

Insect Ecology

Behavior, Populations and Communities

P.W. Price, R.F. Denno
M.D. Eubanks, D.L. Finke
and I. Kaplan

CONTENTS

Preface *page* ix
Acknowledgments *xiii*

Part I Introduction 1

1 The scope of insect ecology 3

- 1.1 Fascination with insects 4
- 1.2 Antiquity of insects 4
- 1.3 Insect body plan 4
- 1.4 Richness of the insect fauna 8
- 1.5 Richness of relationships 9
- 1.6 Adaptive radiation 14
- 1.7 Ecosystem processes 17
- 1.8 Ecological questions and answers 19

Applications: Contributions to many disciplines 20

Summary 22

Questions and discussion topics 23

Further reading 23

Part II Behavioral ecology 25

2 Behavior, mating systems and sexual selection 27

- 2.1 The reproductive imperative 28
- 2.2 The life-cycle approach 28
- 2.3 The experimental necessity 28
- 2.4 Survival 29
- 2.5 Foraging behavior 34
- 2.6 A place to live 37
- 2.7 Communication 42
- 2.8 Reproductive behavior 47

Applications: Behavioral approaches to pest regulation 65

Summary 69

Questions and discussion topics 70

Further reading 71

3 Social insects: the evolution and ecological consequences of sociality 72

- 3.1 What are social insects? 73

- 3.2 Levels of sociality: the other social insects 73

- 3.3 Eusociality: the superorganisms 75

- 3.4 Evolution of sociality: Darwin's dilemma 82

- 3.5 The ecological consequences of sociality 87

Applications: Social insects as saviors and pests 91

Summary 94

Questions and discussion topics 95

Further reading 95

Part III Species interactions 97

4 Plant and herbivore interactions 99

- 4.1 Taxonomic occurrence of phytophagy 100
- 4.2 Diet breadth, feeding strategies and herbivore guilds 100
- 4.3 Plant barriers to herbivore attack 105
- 4.4 Plant defense hypotheses 142
- 4.5 The reciprocal effects of plant–insect interactions on distribution and abundance 150
- 4.6 The evolutionary ecology of plant–insect interactions 159

Applications: Plant–insect interaction theory in pest management 178

Summary 181

Questions and discussion topics 183

Further reading 183

5 Lateral interactions: competition, amensalism and facilitation 184

- 5.1 Competition and resource limitation 185
- 5.2 Paradigms of competition theory: evidence for and against 196
- 5.3 Changing perspectives on competition between insect herbivores 207

5.4 Competition in omnivores, detritivores, predators and parasitoids	209	Questions and discussion topics	302
5.5 Comparative overview of competitive interactions	214	Further reading	303
5.6 Facilitation	216		
5.7 Call for broader theory	219		
Applications: Humans and insects as competitors	220		
Summary	222		
Questions and discussion topics	223		
Further reading	223		
6 Mutualisms	224		
6.1 Mutualism as a creative evolutionary force	225	8 Parasite and host interactions	304
6.2 The variety of mutualistic interactions	225	8.1 The parasite and parasitism	305
6.3 Mutualism and the evolution of biodiversity	229	8.2 Kinds of parasites	306
6.4 The origin of mutualisms	234	8.3 The number of parasitic insect species	306
6.5 The give and take in mutualism	235	8.4 Small body size	308
6.6 Cheating	245	8.5 Adaptive radiation of parasites	311
6.7 Adaptive radiation in mutualistic systems	248	8.6 Life-history convergence	315
6.8 Modeling mutualism	255	8.7 Convergence among parasitoids	317
6.9 Complexity of interactions	258	8.8 Phylogenetic tracking of host lineages	321
6.10 An historical note	260	8.9 Geographic mosaics of variation and patch dynamics	326
Applications: Beneficial interactions in agriculture	261	8.10 Damage to the host	329
Summary	266	8.11 Host defenses against parasites	332
Questions and discussion topics	267	8.12 Host behavioral modification by parasites	335
Further reading	267	8.13 Modeling host and parasite interactions	336
		Applications: Harmful and beneficial parasites	340
7 Prey and predator interactions	268	Summary	346
7.1 What is a predator?	269	Questions and discussion topics	347
7.2 The generalized feeding habit of predators	269	Further reading	348
7.3 Predator effects on prey abundance	270		
7.4 Predator responses to changes in prey density	270	Part IV Population ecology	349
7.5 Prey-predator dynamics	276		
7.6 Predation in complex food webs	286	9 Demography, population growth and life tables	351
7.7 Non-consumptive predator impacts on prey	292	9.1 Principles of population growth	352
7.8 Evolutionary response of prey to predation	294	9.2 Feedback loops, density dependence and population regulation	354
Applications: Biological control	297	9.3 Life tables	357
Summary	301	9.4 Comparison of life tables	361
		9.5 Survivorship curves	366
		Applications: Approaching a problem and planning	369
		Summary	371
		Questions and discussion topics	372
		Further reading	372
		10 Life histories	373
		10.1 Scope of studies	374
		10.2 Evolutionary strategies and tactics	374

- 10.3 Comparative life-history studies 374
- 10.4 Adaptations, constraints, trade-offs, resource allocation, costs and benefits and alternative strategies 385
- 10.5 Hypotheses on fecundity variation 387
- 10.6 Timing of reproduction 389
- 10.7 Stabilizing selection on life-history traits 394
- 10.8 Life span of adult insects 397

Applications: Understanding pest species 400

Summary 402

Questions and discussion topics 403

Further reading 403

11 Population dynamics 404

- 11.1 Population patterns 405
- 11.2 The mechanistic understanding of why population density change occurs 415
- 11.3 Complex interactions 426
- 11.4 An evolutionary hypothesis 431
- 11.5 Metapopulation dynamics 432

Applications: Planning and management 435

Summary 437

Questions and discussion topics 438

Further reading 439

Part V Food webs and communities 441

12 Community structure 443

- 12.1 The community 444
- 12.2 The ecological niches of species 447
- 12.3 Community development 454
- 12.4 Community organization and structure 464
- 12.5 Community genetics 471
- 12.6 The time hypothesis or the area hypothesis? 475
- 12.7 Compound communities 477

Applications: Insects in environmental assessment 482

Summary 486

Questions and discussion topics 487

Further reading 488

13 Multitrophic interactions 489

- 13.1 The trophic level concept 490
- 13.2 Plant traits that affect enemy-prey interactions 491

- 13.3 Trophic cascades 514

Applications: Choosing plants to encourage trophic cascades 527

Summary 531

Questions and discussion topics 533

Further reading 534

Part VI Broad patterns in nature 535

14 Biological diversity 537

- 14.1 Scales of biodiversity 538
- 14.2 Sampling species density 538
- 14.3 Importance of pattern detection 541
- 14.4 Gradients of island size and remoteness 541
- 14.5 Latitudinal gradients 549
- 14.6 Altitudinal gradients 563
- 14.7 Time gradients 567
- 14.8 Disturbance gradients 573

Applications: Conserving species richness 575

Summary 580

Questions and discussion topics 582

Further reading 582

15 Planet Earth: patterns and processes 583

- 15.1 The paleobiological record 584
- 15.2 Climate change 590
- 15.3 Ecosystem dynamics 600
- 15.4 Invasions 603
- 15.5 Conservation ecology 609

Applications: Threats and costs 612

Summary 615

Questions and discussion topics 616

Further reading 616
