

Essentials of Thermal System Design and Optimization

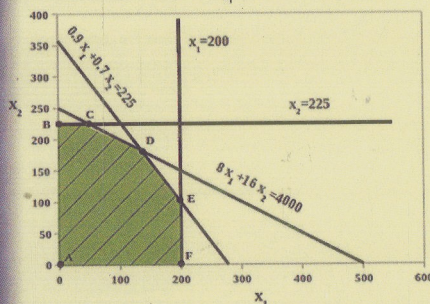

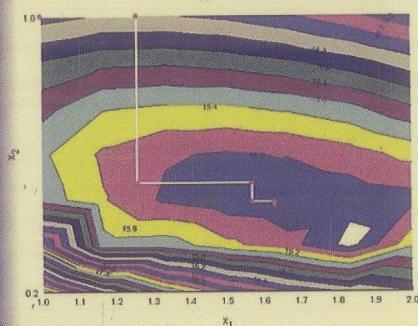

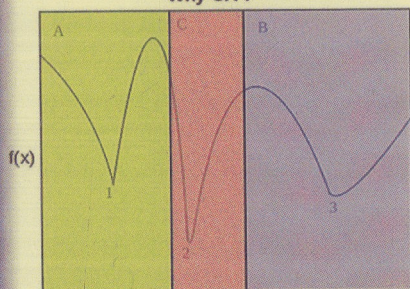

C. Balaji

CRC Press
Taylor & Francis Group

Why GA ?

Contents

1	Introduction to design and system design	1
1.1	Introduction	1
1.2	Design analysis through a flow chart	5
1.3	Optimization	12
1.4	Analysis and Design	13
1.5	Workable system and Optimum system	18
1.6	Optimum design	23
2	System Simulation	29
2.1	Introduction	29
2.2	Some uses of simulation	31
2.3	Different classes of simulation	31
2.4	Information flow diagrams	34
2.5	Techniques for system simulation	39
3	Curve fitting	79
3.1	Introduction	79
3.2	Exact fit and its types	82
3.3	Best fit	96
3.4	Strategies for best fit	98
3.5	Non-linear least squares	119
4	Optimization-Basic ideas and formulation	135
4.1	Introduction	135
4.2	General representation of an optimization problem	140
5	Lagrange multipliers	149
5.1	Introduction	149
5.2	The algorithm	149
5.3	Graphical interpretation of the Lagrange multiplier method	158
5.4	Mathematical proof of the Lagrange multiplier method . .	162

5.5	Economic significance of the Lagrange multipliers	163
5.6	Tests for maxima/minima	164
5.7	Handling inequality constraints	173
5.8	Why should u be positive?	177
6	Search methods	183
6.1	Introduction	183
6.2	Monotonic and unimodal functions	188
6.3	Concept of global and local minimum	190
6.4	Elimination method	193
6.5	Search methods for multivariable unconstrained optimization problem	218
6.6	Constrained multivariable optimization problems	231
7	Linear Programming and Dynamic Programming	237
7.1	Introduction	237
7.2	Linear Programming or LP	237
7.3	Dynamic Programming or DP	250
8	Non-traditional optimization techniques	261
8.1	Introduction	261
8.2	Genetic Algorithms (GA)	261
8.3	Simulated Annealing (SA)	276
9	Inverse problems	289
9.1	Introduction	289
9.2	The Bayesian approach to inverse problems	295
	Bibliography	311
	Random number table	313
	Index	315
