

Table of Contents

Introduction	xiii
Chapter 1. Modeling and Performance Evaluation	1
1.1. Introduction	1
1.2. Markovian processes	2
1.2.1. Overview of stochastic processes	2
1.2.2. Markov processes	3
1.2.2.1. Basics	3
1.2.2.2. Chapman–Kolmogorov equations	4
1.2.2.3. Steady-state probabilities	5
1.2.2.4. Graph associated with a Markov process	6
1.2.2.5. Application to production systems	6
1.2.3. Markov chains	8
1.2.3.1. Basics	8
1.2.3.2. State probability vectors	9
1.2.3.3. Fundamental equation of a Markov chain	9
1.2.3.4. Graph associated with a Markov chain	10
1.2.3.5. Steady states of ergodic Markov chains	11
1.2.3.6. Application to production systems	12
1.3. Petri nets	14
1.3.1. Introduction to Petri nets	14
1.3.1.1. Basic definitions	14
1.3.1.2. Dynamics of Petri nets	15
1.3.1.3. Specific structures	16
1.3.1.4. Tools for Petri net analysis	18
1.3.1.5. Properties of Petri nets	19
1.3.2. Non-autonomous Petri nets	20
1.3.3. Timed Petri nets	20

1.3.4. Continuous Petri nets	23
1.3.4.1. Fundamental equation and performance analysis	24
1.3.4.2. Example	25
1.3.5. Colored Petri nets	27
1.3.6. Stochastic Petri nets	28
1.3.6.1. Firing time	29
1.3.6.2. Firing selection policy	29
1.3.6.3. Service policy	30
1.3.6.4. Memory policy	30
1.3.6.5. Petri net analysis	30
1.3.6.6. Marking graph	31
1.3.6.7. Generator of Markovian processes	31
1.3.6.8. Fundamental equation	32
1.3.6.9. Steady-state probabilities	32
1.3.6.10. Performance indices (steady state)	35
1.4. Discrete-event simulation	36
1.4.1. The role of simulation in logistics systems analysis	36
1.4.2. Components and dynamic evolution of systems	37
1.4.3. Representing chance and the Monte Carlo method	38
1.4.3.1. Uniform distribution $U[0, 1]$	38
1.4.3.2. The Monte Carlo method	39
1.4.4. Simulating probability distributions	41
1.4.4.1. Simulating random events	41
1.4.4.2. Simulating discrete random variables	44
1.4.4.3. Simulating continuous random variables	47
1.4.5. Discrete-event systems	52
1.4.5.1. Key aspects of simulation	52
1.5. Decomposition method	57
1.5.1. Presentation	57
1.5.2. Details of the method	58

Chapter 2. Optimization 61

2.1. Introduction	61
2.2. Polynomial problems and NP-hard problems	62
2.2.1. The complexity of an algorithm	62
2.2.2. Example of calculating the complexity of an algorithm	63
2.2.3. Some definitions	64
2.2.3.1. Polynomial-time algorithms	64
2.2.3.2. Pseudo-polynomial-time algorithms	64
2.2.3.3. Exponential-time algorithms	64
2.2.4. Complexity of a problem	64
2.2.4.1. Polynomial-time problems	64

2.2.4.2. NP-hard problems	64
2.3. Exact methods	64
2.3.1. Mathematical programming	64
2.3.2. Dynamic programming	65
2.3.3. Branch and bound algorithm	65
2.4. Approximate methods	66
2.4.1. Genetic algorithms	67
2.4.1.1. General principles	67
2.4.1.2. Encoding the solutions	67
2.4.1.3. Crossover operators	68
2.4.1.4. Mutation operators	70
2.4.1.5. Constructing the population in the next generation	70
2.4.1.6. Stopping condition	70
2.4.2. Ant colonies	70
2.4.2.1. General principle	70
2.4.2.2. Management of pheromones: example of the traveling salesman problem	71
2.4.3. Tabu search	72
2.4.3.1. Initial solution	73
2.4.3.2. Representing the solution	73
2.4.3.3. Creating the neighborhood	74
2.4.3.4. The tabu list	75
2.4.3.5. An illustrative example	76
2.4.4. Particle swarm algorithm	76
2.4.4.1. Description	76
2.4.4.2. An illustrative example	77
2.5. Multi-objective optimization	79
2.5.1. Definition	79
2.5.2. Resolution methods	80
2.5.3. Comparison criteria	81
2.5.3.1. The Riise distance	81
2.5.3.2. The Zitzler measure	82
2.5.4. Multi-objective optimization methods	82
2.5.4.1. Exact methods	82
2.5.4.2. Approximate methods	84
2.6. Simulation-based optimization	89
2.6.1. Dedicated tools	90
2.6.2. Specific methods	90
Chapter 3. Design and Layout	93
3.1. Introduction	93
3.2. The different types of production system	94
3.3. Equipment selection	97

- 3.3.1. General overview 97
- 3.3.2. Equipment selection with considerations of reliability 99
 - 3.3.2.1. Introduction to reliability optimization 99
 - 3.3.2.2. Design of a parallel-series system 100
- 3.4. Line balancing 110
 - 3.4.1. The classification of line balancing problems 111
 - 3.4.1.1. The simple assembly line balancing model (SALB) 111
 - 3.4.1.2. The general assembly line balancing model (GALB) 112
 - 3.4.2. Solution methods 112
 - 3.4.2.1. Exact methods 112
 - 3.4.2.2. Approximate methods 113
 - 3.4.3. Literature review 113
 - 3.4.4. Example 113
- 3.5. The problem of buffer sizing 114
 - 3.5.1. General overview 116
 - 3.5.2. Example of a multi-objective buffer sizing problem 116
 - 3.5.3. Example of the use of genetic algorithms 117
 - 3.5.3.1. Representation of the solutions 117
 - 3.5.3.2. Calculation of the objective function 118
 - 3.5.3.3. Selection of solutions for the archive 119
 - 3.5.3.4. New population and stopping criterion 119
 - 3.5.4. Example of the use of ant colony algorithms 119
 - 3.5.4.1. Encoding 120
 - 3.5.4.2. Construction of the ant trails 121
 - 3.5.4.3. Calculation of the visibility 121
 - 3.5.4.4. Global and local updates of the pheromones 122
 - 3.5.5. Example of the use of simulation-based optimization 123
 - 3.5.5.1. Simulation model 125
 - 3.5.5.2. Optimization algorithms 129
 - 3.5.5.3. The pairing of simulation and optimization 130
 - 3.5.5.4. Results and comparison 130
- 3.6. Layout 132
 - 3.6.1. Types of facility layout 132
 - 3.6.1.1. Logical layout 132
 - 3.6.1.2. Physical layout 133
 - 3.6.2. Approach for treating a layout problem 133
 - 3.6.2.1. Linear layout 134
 - 3.6.2.2. Functional layout 135
 - 3.6.2.3. Cellular layout 135
 - 3.6.2.4. Fixed layout 135
 - 3.6.3. The best-known methods 135
 - 3.6.4. Example of arranging a maintenance facility 136
 - 3.6.5. Example of laying out an automotive workshop 140

Chapter 4. Tactical Optimization	143
4.1. Introduction	143
4.2. Demand forecasting	143
4.2.1. Introduction	143
4.2.2. Categories and methods	144
4.2.3. Time series	145
4.2.4. Models and series analysis	146
4.2.4.1. Additive models	147
4.2.4.2. Multiplicative model	149
4.2.4.3. Exponential smoothing	150
4.3. Stock management	155
4.3.1. The different types of stocked products	156
4.3.2. The different types of stocks	157
4.3.3. Storage costs	157
4.3.4. Stock management	159
4.3.4.1. Functioning of a stock	159
4.3.4.2. Stock monitoring	161
4.3.4.3. Stock valuation	162
4.3.5. ABC classification method	163
4.3.6. Economic quantities	165
4.3.6.1. Economic quantity: the Wilson formula	166
4.3.6.2. Economic quantity with a discount threshold	167
4.3.6.3. Economic quantity with a uniform discount	168
4.3.6.4. Economic quantity with a progressive discount	169
4.3.6.5. Economic quantity with a variable ordering cost	170
4.3.6.6. Economic quantity with order consolidation	171
4.3.6.7. Economic quantity with a non-zero delivery time	172
4.3.6.8. Economic quantity with progressive input	172
4.3.6.9. Economic quantity with tolerated shortage	173
4.3.7. Replenishment methods	174
4.3.7.1. The (r, Q) replenishment method	175
4.3.7.2. The (T, S) replenishment method	175
4.3.7.3. The (s, S) replenishment method	175
4.3.7.4. The (T, r, S) replenishment method	176
4.3.7.5. The (T, r, Q) replenishment method	177
4.3.7.6. Security stock	177
4.4. Cutting and packing problems	178
4.4.1. Classifying cutting and packing problems	179
4.4.2. Packing problems in industrial systems	183
4.4.2.1. Model	183
4.4.2.2. Solution	185
4.5. Production and replenishment planning, lot-sizing methods	186
4.5.1. Introduction	186

4.5.2. MRP and lot-sizing	186
4.5.3. Lot-sizing methods	187
4.5.3.1. The characteristic elements of the models	188
4.5.3.2. Lot-sizing in the scientific literature	189
4.5.4. Examples	190
4.5.4.1. The Wagner–Whitin method	191
4.5.4.2. The Florian and Klein method	193
4.6. Quality management	198
4.6.1. Evaluation, monitoring and improvement tools	198
4.6.1.1. The objective of metrology	198
4.6.1.2. Concepts of error and uncertainty	198
4.6.1.3. Statistical quality control	199
4.6.1.4. Stages of control	199
4.6.1.5. Tests of normality	200
4.6.2. Types of control	205
4.6.2.1. Reception or final control	205
4.6.2.2. Reception control by measurement	206
4.6.2.3. Manufacturing control	209
4.6.2.4. Control charts	214

Chapter 5. Scheduling 233

5.1. Introduction	233
5.2. Scheduling problems	234
5.2.1. Basic notions	234
5.2.2. Notation	234
5.2.3. Definition of the criteria and objective functions	234
5.2.3.1. Flow time	235
5.2.3.2. Lateness	235
5.2.3.3. Tardiness	235
5.2.3.4. The earliness	236
5.2.3.5. Objective functions	236
5.2.3.6. Properties of schedules	238
5.2.4. Project scheduling	239
5.2.4.1. Definition of a project	239
5.2.4.2. Projects with unlimited resources	240
5.2.4.3. Projects with consumable resources	247
5.2.4.4. Minimal-cost scheduling	252
5.2.5. Single-machine problems	254
5.2.5.1. Minimization of the mean flow time $1/r_i = 0/\sum C_i$	254
5.2.5.2. Minimization of the mean weighted flow time $1/r_i = 0/\sum w_i C_i$	257
5.2.5.3. Minimization of the mean flow time $1/r_i, pmtn/\sum C_i$. . .	257

5.2.5.4. Minimization of the maximum tardiness	
$T_{\max}, 1/r_i = 0/T_{\max}$	259
5.2.5.5. Minimization of the maximum tardiness when the jobs have different arrival dates, with pre-emption	
$1/r_i, pmtn/T_{\max}$	261
5.2.5.6. Minimization of the mean tardiness $1/\bar{T}$	261
5.2.5.7. Minimization of the flow time $1/r_i/\bar{F}$	265
5.2.6. Scheduling a flow shop workshop	267
5.2.6.1. The two-machine problem	267
5.2.6.2. A particular case of the three-machine problem	268
5.2.6.3. The m -machine problem	268
5.2.7. Parallel-machine problems	270
5.2.7.1. Identical machines, $r_i = 0, Min F$	270
5.2.7.2. Identical machines, $r_i = 0, Min C_{\max}$, interruptible jobs	271
Bibliography	273
Index	285
