HEAT TRANSFER

LESSONS WITH EXAMPLES SOLVED BY MATLAB

FIRST EDITION

BY TIEN-MO SHIH

Contents

Preface xix

Lesson 1: Introduction (What and Why) 1

1. Heat Transfer is an Old Subject 1
   1-1 Partially True 2
   1-2 Modifications of the Perception 2
2. What Is the Subject of Heat Transfer? 3
   2-1 Definition 3
   2-2 Second Income 3
3. Candle Burning for Your Birthday Party 5
   3-1 Unknowns and Governing Equations 5
   3-2 Solution Procedure 6
4. Why Is the Subject of Heat Transfer Important? 7
   4-1. Examples of Heat Transfer Problems in Daily Life 7
   4-2 Examples of Heat Transfer Problems in Industrial Applications 8
5. Three Modes of Heat Transfer 8
6. Prerequisites 9
7. Structure of the Textbook 9
8. Summary 10
9. References 10
10. Exercise Problems 11
11. Appendix 11
   A-1 Sum Up 1, 2, 3,..., 100 11
   A-2 Plot f(x) 12
   A-3 Solve Three Linear Equations 12

Lesson 2: Introduction (Three Laws) 13

1. Fourier's Law 13
2. Law of Convective Heat Transfer 15
3. Wind-Chill Factor (WCF) 16
4. Stefan-Boltzmann Law of Radiative Emission 17
5. Sheet Energy Balance 18
6. Formation of Ice Layers on Car Windshield and Windows 18
   6-1 Clear Sky Overnight 18
   6-2 Cloudy Sky Overnight 20
7. Rule of Assume, Draw, and Write (ADW) 20
8. Summary 22
9. References 22
10. Exercise Problems 22
11. Appendix: Taylor's Series Expansion 23

Lesson 3: One-Dimensional Steady State Heat Conduction 25

1. Governing Equation for T(x) or T(i) 25
2. A Single-Slab System 26
3. A Two-Slab System 28
4. Three or More Slabs 29
5. Severe Restrictions Imposed by Using Electrical Circuit Analogy 30
6. Other Types of Boundary Conditions 30
7. Thermal Properties of Common Materials — Table 1 31
8. Summary 31
9. References 31
10. Exercise Problems 31
11. Appendix: A Matlab Code for One-D Steady-State Conduction 32

Lesson 4: One-Dimensional Slabs with Heat Generation 35

1. Introduction 35
2. Governing Equations 36
3. Heat Conduction Related to Our Bodies 37
   3-1 Estimate the Heat Generation of Our Bodies 37
   3-2 A Coarse Grid System 39
   3-3 Optimization 40
4. Discussions 41
   4-1 Radiation Boundary Condition 41
   4-2 Sketch the Trends and Check our Speculations with Running the Matlab Code 42
   4-3 Check the Global Energy Balance 43
5. Summary 43
6. References 43
7. Exercise Problems 43
8. Appendix: A Matlab Code for Optimization 44

Lesson 5: One-Dimensional Steady-State Fins 47

1. Introduction 48
   1-1 Main Purpose of Fins 48
   1-2 Difference between 1-D Slabs and 1-D Fins 49
   1-3 A Quick Estimate 49
2. Formal Analyses 51
   2-1 Governing Equation 51
   2-2 A Standard Matlab Code Solving T(x) and q_b for a Fin 51
   2-3 Equivalent Governing Differential Equation 52
3. Fins Losing Radiation to Clear Sky Overnight 52
4. A Seemingly Puzzling Phenomenon 54
5. Fin Efficiency 55
6. Optimization 55
   6-1 Constraint of Fixed Total Volume 56
   6-2 Optimization for Rod Bundles 56

7. Summary 58
8. References 58
9. Exercise Problems 58
10. Appendix 59
A-1 Explanation of the Seemingly Puzzling Phenomenon 59
A-2 Cubic Temperature Profile 60
A-3 Constraint of Fixed Fin Mass (or Volume) 62
A-4 Fin Bundles and Optimization 63

Lesson 6: Two-Dimensional Steady-State Conduction 65

1. Governing Equations 66
1-1 Derivation of the General Governing Equation 66
1-2 Three-Interior-Node System 67
1-3 A Special Case 70
2. A Standard Matlab Code Solving 2-D Steady-State Problems 70
3. Maximum Heat Loss from a Cylinder Surrounded by Insulation Materials 70
3-1. Governing Equation 71
3-2 An Optimization Problem 72
4. Summary 72
5. References 73
6. Exercise Problems 73
7. Appendix 74
A-1 Gauss-Seidel Method 74
A-2 A Standard 2-D Steady State Code 75
A-3 Optimization Problem in the Cylindrical Coordinates 77

Lesson 7: Lumped-Capacitance Models (Zero-Dimension Transient Conduction) 79

1. Introduction 79
1-1 Adjectives 79
1-2 Justifications 80

1-3 Examples 80
1-4 Objectives and Control Volumes 81
1-5 The Most Important Term and the First Law of Thermodynamics 81
2. Detailed Analyses of a Can-of-Coke Problem 82
2-1 Modeling 82
2-2 Assumptions in the Modeling 83
2-3 A Matlab Code Computing T(t) for the Can of Coke Problem 83
2-4 Discussions 84
3. When Is It Appropriate to Use the Lumped-Capacitance Model? 85
3-1 A Three-Node Example 85
3-2 An Analogy 86
4. A Simple Way to Relax the Bi < 0.002 Constraint 87
5. Why Stirring the Food When We Fry It? 88
6. Summary 90
7. References 90
8. Exercise Problems 90
9. Appendix 91
A-1 Discussions of Adjectives 91
A-2 Comparisons of Three Cases 92

Lesson 8: One-Dimensional Transient Heat Conduction 95

1. Kitchen Is a Good Place to Learn Heat Transfer 95
1-1 Governing Equation of One-D Transient Heat Conduction 95
1-2 The Generic Core of One-D Transient Code 97
1-3 Various Boundary Conditions 97
1-4 A One-D Transient Matlab Code 97
1-5 Global Energy Balance 99
2. Other One-D Transient Heat Conduction Applications 100
2-1. Semi-Infinite Solids 100
2-2. Revisit Fin Problems 100
2-3. Multi-layer Slabs with Heat Generation 102

3. Differential Governing Equation for One-D Transient Heat Conduction 103
4. Summary 103
5. References 103
6. Exercise Problems 103
7. Appendix 104
A-1 Semi-infinite Solids 104
A-2 Transient 1-D Fins 105
A-3 Example 4-1 Revisited 106

Lesson 9: Two-D Transient Heat Conduction 109

1. Governing Equation for T(i, j) 109
1-1 General Case 109
1-2 Special Cases 110
2. A Standard Matlab Code for Readers to Modify 113
3. Speculation on Steel Melting in Concrete Columns during 9/11 113
4. Possible Numerical Answers 114
5. Use a Two-D code to Solve One-D Transient Heat Conduction Problems 115
6. Exact Solutions for Validation of Codes 116
7. Advanced Heat Conduction Problems 117
7-1 Moving Interface (or called Stefan Problem) 117
7-2. Irregular Geometries 118
7-3. Non-Fourier Law (Hyperbolic-Type Heat Conduction Equation) 118
8. Summary 120
9. References 120
10. Exercise Problems 120
11. Appendix 121
A-1 A Standard Transient 2-D Code for Readers to Modify 121
A-2. Investigation of Transient 1-D Heat Conduction for a Steel Column 122
A-3. Investigation of Transient 2-D Heat Conduction for the Concrete Column 123

Lesson 10: Forced-Convection External Flows (I) 125

1. Soup-Blowing Problem 125
2. Boundary- Layer Flows 128
3. A Cubic Velocity Profile 130
   3–1 Determine the coefficients 130
   3-2 Application of Eq. (3) 131
4. Summary 133
5. References 133
6. Exercise Problems 133
7. Appendix: Momentum Balance over an Integral Segment 136

Lesson 11: Forced-Convection External Flows (II) 139

1. Nondimensionalization (abbreviated as Ndm) 139
2. Important Dimensionless Parameters in Heat Transfer 144
3. Derivation of Governing Equations 144
4. Categorization 145
5. Summary 146
6. References 146
7. Exercise Problems 146
8. Appendix: Steady-State Governing Equations 148
   A-1 Derivation of Governing Equation for u 148
   A-2 Governing Equation for T 152

Lesson 12: Forced-Convection External Flows (III) 153

1. Preliminary 153
2. A Classical Approach Reported in the Literature 158
3. Steps to Find Heat Flux at the Wall (from the Similarity Solution) 156
4. The Nu Correlation and Some Discussions 157
5. Derivation of Nu = G (Re, Pr) by Ndm 159
6. Finding Eq. (6b) by Using a Quick and Approximate Method 160
   - **6-1. A Quick and Approximate Method** 160
   - **6-2. A Matlab code generating the Nu correlation** 161
7. An Example Regarding Convection and Radiation Combined 163
8. Possible Shortcomings of Nu Correlations 164
9. Brief Examination of Two More External Flows 164
10. Summary 165
11. References 165
12. Exercise Problems 166
13. Appendix [to find $f'(\eta)$ and the value of $f''(0)$] 168
    - **A-1 A Matlab Code for Solving the Blasius Similarity Equation** 168
    - **A-2 Table of η, f, f', f'' Distributions** 169
    - **A-3 Brief Explanations of the Table** 171

Lessons 13: Internal Flows (I)—Hydrodynamic Aspect 173

1. Main Differences Between External Flows and Internal Flows 174
2. Two Regimes (or Regions) 174
3. A Coarse Grid to Find u, v, and p in the Developing Regime 176
4. An Analytical Procedure of Finding u(y) in the Fully Developed Regime 178
5. Application of the Results 182

6. Which Value Should We Use? 183
7. Ndm and Parameter Dependence 184
8. Summary 184
9. References 184
10. Exercise Problems 185
11. Appendix A Matlab Code for Finding u, v, and p in the Developing Regime 187

Lessons 14: Internal Flows (II)---Thermal Aspect 189

1. Definition of Tm 189
2. Definition of Thermally Fully Developed Flows 190
3. Justification of $\partial T/\partial x$ = constant 191
4. A Beneficial Logical Exercise of Genetics 193
5. Summary 194
6. References 194
7. Exercise Problems 194

Lessons 15: Internal Flows (III)---Thermal Aspect 197

1. Derivation of Nu Value for Uniform q''s 197
2. Important Implications of Eq. (5) 199
3. Derivation of Nu value for uniform Ts 200
3-1 Justification 201
3-2 Solution Procedure 202

4. Let the Faucet Drip Slowly 204
5. Summary 207
6. References 207
7. Exercise Problems 207
8. Appendix: A Matlab Code Computing Nu for the Case of Uniform Ts 208

Lesson 16: Free Convection 211

1. Definition of Free Convection 211
2. Definition of Buoyancy Force 212
2-1 Buoyancy Force on an Object 212
2-2 Buoyancy Force on a Control Volume in the Flow 213
2-3 Density Variations 214
3. The Main Difference Between Free Convection and Forced Convection 214
4. How Does Gr Number Arise? 215
5. δ_T and δ in Free Convection 216
6. A Four-Cell Buoyancy-Driven Flow in a Square Enclosure 217
6-1 Description 217
6-2 Derivation of Governing Equations 218
6-3 Discussions of the Result 219
7. Does Lighting a Fire in Fireplace Gain Net Energy for the House? 219
7-1 Governing Equations 220
7-2 Nomenclature in the Code 220
7-3 Matlab Code 220
8. Solar Radiation-Ice Turbine 221
8-1 Description of the Machine 221
8-2 Some Analyses 222

9. Free Convection over a Vertical Plate 223
10. Summary 224
11. References 224
12. Exercise Problems 224
13. Appendix: A Matlab Code Computing Buoyancy-Driven Flows in Four-Cell Enclosures 224

Lesson 17: Turbulent Heat Convection 227

1. Introduction 228
1-1 Speed of Typical Flows 228
1-2 Frequencies of Turbulence and Molecular Collision 228
1-3 Superposition 228
2. A Fundamental Analysis 229
2-1 Governing Equations 229
2-2 Zero-Equation Turbulence Model 230
2-3 Discretized Governing Equation 231
3. Matlab Codes 232
3-1 Laminar Flows in Two-Parallel-Plate Channels 232
3-2 Turbulent Flows 233
3-3 Laminar Flows in Circular Tubes 233
4. Dimples on Golf Balls 234
5. Summary 235
6. References 235
7. Exercise Problems 235
8. Appendix 235
A-1 Laminar Flows in Circular Tubes 235
A-2 Fully Developed Turbulent Flows in Planar Channels 236

Lesson 18: Heat Exchangers and Other Heat Transfer Applications 239

1 Types of Heat Exchangers 239
2. A Fundamental Analysis 240
3. A Traditional Method to Find Heat Exchange 241
4. A Matlab Code 242
5. Comments on the Code 244
6. Other Applications in Heat Transfer 244
6-1 Combustion and Low-Temperature Chemical Reactions 244
6-2 Jets, Plumes, and Wakes 245
6-3 Optimization 245
6-4 Porous Media 245
6-5 Radiation with Participating Gases 245
6-6 Two-Phase Flows 245
7. Summary 246
8. References 246
9. Exercise Problems 247

Lesson 19: Radiation (I) 249

1. Fundamental Concepts 249
1-1 Main Difference between Radiation and Convection 250
1-2 Adjectives Used for Radiative Properties 250
2. Blackbody Radiation 251
2-1. Definition of a Blackbody Surface 251
2-2. Planck Spectral Distribution 252
2-3. Stefan-Boltzmann Law 253

3. A Coffee Drinking Tip 254
4. Fractions of Blackbody Emission 256
5. Summary 257
6. References 257
7. Exercise Problems 257
8. Appendix 258
A-1 Finding the Value of Stefan-Boltzmann Constant 258
A-2 Table 19-1 Fractions of Blackbody Emission 259

Lesson 20: Radiation (II) 261

1. Emissivity 261
2. Three Other Radiative Properties 263
3. Solar Constant and Effective Temperature of the Sun 264
4. Gray Surfaces 266
5. Kirchhoff's Law 268
6. Energy Balance over a Typical Plate 269
7. Greenhouse Effect (or Global Warming) 269
8. Steady-State Heat Flux Supplied Externally by Us 271
9. Find Steady-State Ts Analytically 272
10. Find Steady-State Ts Numerically 272
11. Find Unsteady Ts Not Involved with the Spectral Emissivity 273
12. Find Unsteady Ts Involved with the Spectral Emissivity 274
13. Find Unsteady Ts with Parameters Being Functions of Wavelength and Time 275
14. Summary 277
15. References 277
16. Exercise Problems 277

1. View Factors (or Shape Factors, Configuration Factors) 281
1-1 Definition of the View Factor, F_{12} 282
1-2 Reciprocity Rule 282
1-3 Energy Conservation Rule 282
1-4 View Factor for a Triangle 283
2. Black Triangular Enclosures 283
3. Gray Triangular Enclosures 285
3-1 Definition of Radiosity, J 286
4. Two Parallel Gray Plates with A1 = A2 288
5. Radiation Shield 289
6. Summary 290
7. References 290
8. Exercise Problems 290
