|                                                                                         |      |
|-----------------------------------------------------------------------------------------|------|
| <b>Foreword.</b> . . . . .                                                              | xi   |
| <b>Introduction.</b> . . . . .                                                          | xiii |
| <b>Chapter 1. Decentralized Electricity Production from Renewable Energy.</b> . . . . . | 1    |
| Benoît ROBYNS                                                                           |      |
| 1.1. Decentralized production. . . . .                                                  | 1    |
| 1.2. The issue of renewable energies. . . . .                                           | 2    |
| 1.2.1. Observations. . . . .                                                            | 2    |
| 1.2.2. The sustainable development context . . . . .                                    | 6    |
| 1.2.3. Commitments and perspectives. . . . .                                            | 6    |
| 1.3. Renewable energy sources . . . . .                                                 | 9    |
| 1.3.1. Wind energy . . . . .                                                            | 9    |
| 1.3.2. Solar energy . . . . .                                                           | 9    |
| 1.3.3. Hydraulics . . . . .                                                             | 11   |
| 1.3.4. Geothermal energy . . . . .                                                      | 11   |
| 1.3.5. Biomass . . . . .                                                                | 12   |
| 1.3.6. Contribution of the various renewable energies . . . . .                         | 13   |
| 1.4. Production of electricity from renewable energies . . . . .                        | 14   |
| 1.4.1. Electricity supply chains. . . . .                                               | 14   |
| 1.4.2. Efficiency factor . . . . .                                                      | 16   |
| 1.5. Bibliography . . . . .                                                             | 17   |
| <b>Chapter 2. Solar Photovoltaic Power</b> . . . . .                                    | 19   |
| Arnaud DAVIGNY                                                                          |      |
| 2.1. Introduction. . . . .                                                              | 19   |
| 2.2. Characteristics of the primary resource . . . . .                                  | 21   |

|                                                                  |    |
|------------------------------------------------------------------|----|
| 2.3. Photovoltaic conversion . . . . .                           | 25 |
| 2.3.1. Introduction . . . . .                                    | 25 |
| 2.3.2. Photovoltaic effect . . . . .                             | 25 |
| 2.3.3. Photovoltaic cells . . . . .                              | 27 |
| 2.3.4. Cell association . . . . .                                | 43 |
| 2.4. Maximum electric power extraction . . . . .                 | 49 |
| 2.5. Power converters . . . . .                                  | 53 |
| 2.5.1. Introduction . . . . .                                    | 53 |
| 2.5.2. Structure of the photovoltaic conversion chains . . . . . | 53 |
| 2.5.3. Choppers . . . . .                                        | 56 |
| 2.5.4. Inverters . . . . .                                       | 60 |
| 2.6. Adjustment of the active and reactive power . . . . .       | 64 |
| 2.7. Solar power stations . . . . .                              | 65 |
| 2.7.1. Introduction . . . . .                                    | 65 |
| 2.7.2. Autonomous power stations . . . . .                       | 66 |
| 2.7.3. Power stations connected to the network . . . . .         | 66 |
| 2.8. Exercises . . . . .                                         | 67 |
| 2.8.1. Characteristic of a photovoltaic panel . . . . .          | 67 |
| 2.8.2. Sizing an autonomous photovoltaic installation . . . . .  | 69 |
| 2.9. Bibliography . . . . .                                      | 72 |

## **Chapter 3. Wind Power . . . . . 75**

Bruno FRANCOIS and Benoît ROBYNS

|                                                                                                             |    |
|-------------------------------------------------------------------------------------------------------------|----|
| 3.1. Characteristic of the primary resource . . . . .                                                       | 75 |
| 3.1.1. Variability . . . . .                                                                                | 75 |
| 3.1.2. The Weibull distribution . . . . .                                                                   | 76 |
| 3.1.3. The effect of relief . . . . .                                                                       | 79 |
| 3.1.4. Loading rate . . . . .                                                                               | 80 |
| 3.1.5. Compass card . . . . .                                                                               | 81 |
| 3.2. Kinetic wind energy . . . . .                                                                          | 82 |
| 3.3. Wind turbines . . . . .                                                                                | 83 |
| 3.3.1. Horizontal axis wind turbines . . . . .                                                              | 83 |
| 3.3.2. Vertical axis wind turbines . . . . .                                                                | 91 |
| 3.3.3. Comparison of the various turbine types . . . . .                                                    | 94 |
| 3.4. Power limitation by varying the power coefficient . . . . .                                            | 95 |
| 3.4.1. The “pitch” or variable pitch angle system . . . . .                                                 | 96 |
| 3.4.2. The “stall” or aerodynamic stall system . . . . .                                                    | 97 |
| 3.5. Mechanical couplings between the turbine and the<br>electric generator . . . . .                       | 99 |
| 3.5.1. Connection between mechanical speed, synchronous speed<br>and electrical network frequency . . . . . | 99 |

|                                                                                     |     |
|-------------------------------------------------------------------------------------|-----|
| 3.5.2. “Direct drive” wind turbines (without a multiplier) . . . . .                | 100 |
| 3.5.3. Use of a speed multiplier . . . . .                                          | 101 |
| 3.6. Generalities on induction and mechanical electric conversion . . . . .         | 101 |
| 3.7. “Fixed speed” wind turbines based on induction machines. . . . .               | 103 |
| 3.7.1. Physical principle. . . . .                                                  | 103 |
| 3.7.2. Constitution of induction machines . . . . .                                 | 104 |
| 3.7.3. Modeling. . . . .                                                            | 105 |
| 3.7.4. Conversion system . . . . .                                                  | 109 |
| 3.7.5. Operation characteristics . . . . .                                          | 111 |
| 3.8. Variable speed wind turbine . . . . .                                          | 112 |
| 3.8.1. Issues . . . . .                                                             | 112 |
| 3.8.2. Classification of the structures according to machine technologies . . . . . | 113 |
| 3.8.3. Principle of element sizing . . . . .                                        | 115 |
| 3.8.4. Adjustment of active and reactive powers . . . . .                           | 117 |
| 3.8.5. Aerogenerators based on a doubly fed induction machine . . . . .             | 122 |
| 3.8.6. Aerogenerators based on a synchronous machine . . . . .                      | 128 |
| 3.9. Wind turbine farms . . . . .                                                   | 135 |
| 3.10. Exercises. . . . .                                                            | 137 |
| 3.10.1. Fixed speed wind turbines . . . . .                                         | 137 |
| 3.10.2. Characterization of a turbine and estimate of the generated power . . . . . | 139 |
| 3.10.3. High power variable speed wind turbines . . . . .                           | 143 |
| 3.11. Bibliography . . . . .                                                        | 146 |

## **Chapter 4. Terrestrial and Marine Hydroelectricity: Waves and Tides.**

Benoît ROBYNS and Antoine HENNETON

|                                                                               |     |
|-------------------------------------------------------------------------------|-----|
| 4.1. Run-of-the-river hydraulics . . . . .                                    | 149 |
| 4.1.1. Hydroelectricity. . . . .                                              | 149 |
| 4.1.2. Small hydraulics . . . . .                                             | 152 |
| 4.1.3. Hydraulic turbines . . . . .                                           | 154 |
| 4.1.4. Electromechanical conversion for small hydroelectricity . . . . .      | 160 |
| 4.1.5. Exercise: small hydroelectric run-of-the-river power station . . . . . | 163 |
| 4.2. Hydraulic power of the sea. . . . .                                      | 172 |
| 4.2.1. Wave power . . . . .                                                   | 172 |
| 4.2.2. Energy of the continuous ocean currents . . . . .                      | 177 |
| 4.2.3. Tidal energy . . . . .                                                 | 179 |
| 4.2.4. Wave production, wave-power generator. . . . .                         | 185 |
| 4.2.5. Production by sea currents . . . . .                                   | 206 |
| 4.2.6. Tidal production . . . . .                                             | 216 |

|                                                                                                     |            |
|-----------------------------------------------------------------------------------------------------|------------|
| 4.2.7. Exercise: Estimation of the production of a simple effect tidal power. . . . .               | 226        |
| 4.3. Bibliography . . . . .                                                                         | 227        |
| <b>Chapter 5. Thermal Power Generation. . . . .</b>                                                 | <b>233</b> |
| Jonathan SPROOTEN                                                                                   |            |
| 5.1. Introduction. . . . .                                                                          | 233        |
| 5.2. Geothermal power. . . . .                                                                      | 233        |
| 5.2.1. Introduction . . . . .                                                                       | 233        |
| 5.2.2. The resource. . . . .                                                                        | 234        |
| 5.2.3. Fluid characteristics . . . . .                                                              | 235        |
| 5.2.4. The principle of geothermal power plants . . . . .                                           | 237        |
| 5.2.5. Thermodynamic conversion. . . . .                                                            | 239        |
| 5.2.6. Steam turbine . . . . .                                                                      | 244        |
| 5.2.7. The alternator . . . . .                                                                     | 246        |
| 5.3. Thermodynamic solar power generation. . . . .                                                  | 252        |
| 5.3.1. Introduction . . . . .                                                                       | 252        |
| 5.3.2. The principle of concentration . . . . .                                                     | 253        |
| 5.3.3. Cylindro-parabolic design. . . . .                                                           | 258        |
| 5.3.4. The solar tower . . . . .                                                                    | 261        |
| 5.3.5. Parabolic dish design. . . . .                                                               | 261        |
| 5.3.6. Comparison of solar thermodynamic generations . . . . .                                      | 263        |
| 5.4. Cogeneration by biomass. . . . .                                                               | 264        |
| 5.4.1. Origin of biomass – energy interests . . . . .                                               | 264        |
| 5.4.2. Cogeneration principle. . . . .                                                              | 265        |
| 5.5. Bibliography . . . . .                                                                         | 268        |
| <b>Chapter 6. Integration of the Decentralized Production into the Electrical Network . . . . .</b> | <b>271</b> |
| Benoît ROBYNS                                                                                       |            |
| 6.1. From a centralized network to a decentralized network . . . . .                                | 271        |
| 6.1.1. The transport network . . . . .                                                              | 271        |
| 6.1.2. The distribution network . . . . .                                                           | 272        |
| 6.1.3. Services for the electric system. . . . .                                                    | 274        |
| 6.1.4. Towards network decentralization . . . . .                                                   | 278        |
| 6.2. Connection voltage . . . . .                                                                   | 279        |
| 6.3. Connection constraints . . . . .                                                               | 279        |
| 6.3.1. Voltage control . . . . .                                                                    | 279        |
| 6.3.2. Frequency control. . . . .                                                                   | 282        |
| 6.3.3. Quality of the electric wave. . . . .                                                        | 283        |
| 6.3.4. Short-circuit power. . . . .                                                                 | 284        |
| 6.3.5. Protection of the electric system . . . . .                                                  | 285        |

## Table of Contents

|                                                                       |            |
|-----------------------------------------------------------------------|------------|
| 6.3.6. Coupling of the production facilities to the network . . . . . | 286        |
| 6.3.7. Other constraints . . . . .                                    | 287        |
| 6.4. Limitations of the penetration level. . . . .                    | 287        |
| 6.4.1. Participation in ancillary services . . . . .                  | 287        |
| 6.4.2. Untimely disconnections . . . . .                              | 288        |
| 6.4.3. Production prediction . . . . .                                | 289        |
| 6.4.4. Network hosting capacity . . . . .                             | 289        |
| 6.5. Perspectives for better integration into the networks . . . . .  | 290        |
| 6.5.1. Actions at the source level . . . . .                          | 290        |
| 6.5.2. Actions on the network level . . . . .                         | 293        |
| 6.5.3. Actions on the consumer level . . . . .                        | 298        |
| 6.6. Bibliography . . . . .                                           | 300        |
| <b>List of Authors . . . . .</b>                                      | <b>305</b> |
| <b>Index . . . . .</b>                                                | <b>307</b> |
