Preface.....	vii
About the author	ix
Chapter 1 Introduction	1
1.1 Color and near-infrared light.....	1
1.2 Types of NIR materials	5
1.3 Current uses of and needs for NIR materials.....	7
References	10
Chapter 2 Molecular design and energy gap tuning.....	13
2.1 Effect of conjugation length	13
2.2 Effect of bond length alternation.....	19
2.3 Effect of donor–acceptor charge transfer	23
2.4 Other effects	28
References	29
Chapter 3 Near-infrared organic compounds.....	33
3.1 NIR compounds containing rylene chromophores.....	33
3.2 NIR compounds containing polymethine and meropolymethine chromophores.....	40
3.3 NIR compounds containing donor–acceptor chromophores.....	52
3.4 NIR compounds containing metal complex chromophores	64
3.5 Selective NIR-absorbing compounds.....	73
References	78
Chapter 4 Near-infrared absorbing polymers	85
4.1 Nonconjugated NIR-absorbing polymers	87
4.2 Conjugated quinoid type polymers	89
4.3 Conjugated dye-containing polymers	91
4.3.1 Polysquaraines and polycroconaines	91
4.3.2 Conjugated polymers based on other organic dyes	94

4.4	Donor–acceptor conjugated polymers	98
4.4.1	Effect of spacer units	102
4.4.2	Effect of electron acceptors.....	105
4.4.3	Effect of electron donors.....	108
References		109
 Chapter 5 Emerging applications of near-infrared organic materials		115
5.1	Applications based on NIR-absorbing property	115
5.2	Applications based on NIR chromogenic property.....	122
5.3	Photovoltaic applications using NIR organic materials.....	130
5.4	Transistor applications using low band-gap polymers.....	148
5.5	Applications based on NIR fluorescent property	149
References		162
 Index		 171
