<b>Foreword</b>	<b>xi</b>
<b>Preface</b>	<b>xiii</b>
<b>1. Introduction</b>	<b>1</b>
1.1 Introduction of Electronic Package Integration,	1
1.2 Review of Modeling Technologies,	6
1.3 Organization of the Book,	10
References,	11
<b>2. Macromodeling of Complex Interconnects in 3D Integration</b>	<b>16</b>
2.1 Introduction,	16
2.1.1 Scope of macromodeling,	18
2.1.2 Macromodeling in the picture of electrical modeling of interconnects,	19
2.2 Network Parameters: Impedance, Admittance, and Scattering Matrices,	19
2.2.1 Impedance matrix,	21
2.2.2 Admittance matrix,	22
2.2.3 Scattering matrix,	23
2.2.4 Conversion between $Z$ , $Y$ , and $S$ matrices,	24
2.3 Rational Function Approximation with Partial Fractions,	25
2.3.1 Introduction,	25
2.3.2 Iterative weighted linear least-squares estimator,	27
2.4 Vector Fitting (VF) Method,	29
2.4.1 Two steps in vector fitting method,	29
2.4.2 Fitting vectors with common poles,	35
2.4.3 Selection of initial poles,	37
2.4.4 Enhancement to the original vector fitting method,	38
2.5 Macromodel Synthesis,	41
2.5.1 Jordan canonical method for macromodel synthesis,	42
2.5.2 Equivalent circuits,	46

- 2.6 Stability, Causality, and Passivity of Macromodel, 48
  - 2.6.1 Stability, 48
  - 2.6.2 Causality, 50
  - 2.6.3 Passivity assessment, 54
  - 2.6.4 Passivity enforcement, 58
  - 2.6.5 Other issues, 78
- 2.7 Macromodeling Applied to High-Speed Interconnects and Circuits, 79
  - 2.7.1 A lumped circuit with nonlinear components, 79
  - 2.7.2 Vertically natural capacitors (VNCAPs), 83
  - 2.7.3 Stripline-to-microstrip line transition with vias, 87
- 2.8 Conclusion, 91
  - References, 92

### **3. 2.5D Simulation Method for 3D Integrated Systems**

**97**

- 3.1 Introduction, 97
- 3.2 Multiple Scattering Method for Electronic Package Modeling with Open Boundary Problems, 98
  - 3.2.1 Modal expansion of fields in a parallel-plate waveguide (PPWG), 98
  - 3.2.2 Multiple scattering coefficients among cylindrical PEC and perfect magnetic conductor (PMC) vias, 101
  - 3.2.3 Excitation source and network parameter extraction, 109
  - 3.2.4 Implementation of effective matrix-vector multiplication (MVM) in linear equations, 117
  - 3.2.5 Numerical examples for single-layer power-ground planes, 121
- 3.3 Novel Boundary Modeling Method for Simulation of Finite-Domain Power-Ground Planes, 127
  - 3.3.1 Perfect magnetic conductor (PMC) boundary, 128
  - 3.3.2 Frequency-dependent cylinder layer (FDCL), 128
  - 3.3.3 Validations of FDCL, 131
- 3.4 Numerical Simulations for Finite Structures, 133
  - 3.4.1 Extended scattering matrix method (SMM) algorithm for finite structure simulation, 133
  - 3.4.2 Modeling of arbitrarily shaped boundary structures, 139

- 3.5 Modeling of 3D Electronic Package Structure, 142
  - 3.5.1 Modal expansions and boundary conditions, 143
  - 3.5.2 Mode matching in PPWGs, 150
  - 3.5.3 Generalized  $T$ -matrix for two-layer problem, 158
  - 3.5.4 Formulae summary for two-layer problem, 164
  - 3.5.5 Formulae summary for 3D structure problem, 169
  - 3.5.6 Numerical simulations for multilayered power-ground planes with multiple vias, 176
- 3.6 Conclusion, 182
  - References, 183

#### **4. Hybrid Integral Equation Modeling Methods for 3D Integration** **185**

- 4.1 Introduction, 185
- 4.2 2D Integral Equation Equivalent Circuit (IEEC) Method, 186
  - 4.2.1 Overview of the algorithm, 186
  - 4.2.2 Modal decoupling inside the power distribution network (PDN), 187
  - 4.2.3 2D integral equation solution of parallel plate mode in power-ground planes (PGPs), 189
  - 4.2.4 Combinations of transmission and parallel plate modes, 194
  - 4.2.5 Cascade connections of equivalent networks, 205
  - 4.2.6 Simulation results, 214
- 4.3 3D Hybrid Integral Equation Method, 220
  - 4.3.1 Overview of the algorithm, 220
  - 4.3.2 Equivalent electromagnetic currents and dyadic green's functions, 224
  - 4.3.3 Simulation results, 231
- 4.4 Conclusion, 238
  - References, 238

#### **5. Systematic Microwave Network Analysis for 3D Integrated Systems** **241**

- 5.1 Intrinsic Via Circuit Model for Multiple Vias in an Irregular Plate Pair, 242
  - 5.1.1 Introduction, 242
  - 5.1.2 Segmentation of vias and a plate pair, 245

- 5.1.3 An intrinsic 3-port via circuit model, 248
- 5.1.4 Determination of the virtual via boundary, 263
- 5.1.5 Complete model for multiple vias in an irregular plate pair, 267
- 5.1.6 Validation and measurements, 269
- 5.1.7 Conclusion, 280
- 5.2 Parallel Plane Pair Model, 281
  - 5.2.1 Introduction, 281
  - 5.2.2 Overview of two conventional  $Z_{pp}$  definitions, 283
  - 5.2.3 New  $Z_{pp}$  definition using the zero-order parallel plate waves, 285
  - 5.2.4 Analytical formula for radial scattering matrix  $\mathbf{S}_{pp}^R$  in a circular plate pair, 290
  - 5.2.5 BIE method to evaluate  $\mathbf{S}_{pp}^R$  for an irregular plate pair, 292
  - 5.2.6 Numerical examples and measurements, 296
  - 5.2.7 Conclusion, 303
- 5.3 Cascaded Multiport Network Analysis of Multilayer Structure with Multiple Vias, 305
  - 5.3.1 Introduction, 305
  - 5.3.2 Multilayer PCB with vias and decoupling capacitors, 307
  - 5.3.3 Systematic microwave network method, 308
  - 5.3.4 Validations and discussion, 316
  - 5.3.5 Conclusion, 324
- Appendix: Properties of the Auxiliary Function  $W_{mn}(x, y)$ , 326
- References, 327

## 6. Modeling of Through-Silicon Vias (TSV) in 3D Integration

331

- 6.1 Introduction, 331
  - 6.1.1 Overview of process and fabrication of TSV, 332
  - 6.1.2 Modeling of TSV, 335
- 6.2 Equivalent Circuit Model for TSV, 336
  - 6.2.1 Overview, 337
  - 6.2.2 Problem statement: Two-TSV configuration, 338
  - 6.2.3 Wideband Pi-type equivalent-circuit model, 339

- 6.2.4 Rigorous closed-form formulae for resistance and inductance, 341
- 6.2.5 Scattering parameters of two-TSV system, 345
- 6.2.6 Results and discussion. 346
- 6.3 MOS Capacitance Effect of TSV, 351
  - 6.3.1 MOS capacitance effect, 351
  - 6.3.2 Bias voltage-dependent MOS capacitance of TSVs, 351
  - 6.3.3 Results and analysis, 355
- 6.4 Conclusion, 356
  - References, 358
