

Contents

1	Introduction to Functional Analysis in Applications	1
1.1	Example 1: The Heat Equation	1
1.2	Some Preliminaries: Hilbert, Banach, and Other Spaces Useful in Operator Theory	4
1.3	Return to Example 1: Heat Equation	8
1.4	Example 2: General Transport Equation	8
1.5	Example 3: Delay Systems–Insect/Insecticide Models . .	10
1.6	Example 4: Probability Measure Dependent Systems — Maxwell’s Equations	13
1.7	Example 5: Structured Population Models	19
2	Semigroups and Infinitesimal Generators	21
2.1	Basic Principles of Semigroups	21
2.2	Infinitesimal Generators	22
3	Generators	25
3.1	Introduction to Generation Theorems	25
3.2	<i>Hille-Yosida</i> Theorems	25
3.3	Results from the <i>Hille-Yosida</i> Proof	26
3.4	Corollaries to <i>Hille-Yosida</i>	27
3.5	<i>Lumer-Phillips</i> and Dissipative Operators	28
3.6	Examples Using Lumer-Phillips Theorem	34
3.6.1	Return to Example 1: The Heat Equation	34
3.6.2	Return to Example 2: The General Transport Equation	35
3.6.3	Return to Example 3: Delay Systems	36
3.6.4	Return to Example 4: Maxwell’s Equations . . .	40
4	Adjoint Operators and Dual Spaces	47
4.1	Adjoint Operators	47
4.1.1	Computation of A^* : An Example from the Heat Equation	47
4.1.2	Self-Adjoint Operators and Dissipativeness . . .	48
4.2	Dual Spaces and Strong, Weak, and Weak* Topologies .	49
4.2.1	Summary of Topologies on X and X^*	53
4.3	Examples of Spaces and Their Duals	54
4.4	Return to Dissipativeness for General Banach Spaces . .	57

4.5	More on Adjoint Operators	58
4.5.1	Adjoint Operator in a Hilbert Space	59
4.5.2	Special Case	59
4.6	Examples of Computing Adjoint	59
5	Gelfand Triple, Sesquilinear Forms, and Lax-Milgram	63
5.1	Example 6: The Cantilever Beam	63
5.2	The Beam Equation in the Form $\dot{x} = \mathcal{A}x + F$	65
5.2.1	$\mathcal{A}$ as an Infinitesimal Generator	66
5.2.2	Dissipativeness of $\mathcal{A}$	67
5.2.3	$\mathcal{R}(\lambda I - \mathcal{A}) = X$ for some λ	67
5.3	Gelfand Triples	68
5.3.1	Duality Pairing	69
5.4	Sesquilinear Forms	69
5.4.1	Representations	70
5.5	Lax-Milgram—bounded form	71
5.5.1	Discussion of $Ax = f$ with A bounded	72
5.5.2	Example—The Steady State Heat Equation in $H_0^1(\Omega)$	74
5.6	Lax-Milgram—unbounded form	75
5.6.1	The Concept of D_A	77
5.6.2	V-elliptic	79
5.7	Summary Remarks and Motivation	80
6	Analytic Semigroups	81
6.1	Example 1: The Heat Equation (again)	82
6.2	Example 2: The Transport Equation (again)	84
6.3	Example 6: The Beam Equation (again)	86
6.4	Summary of Results on Analytic Semigroup Generation by Sesquilinear Forms	89
6.5	Tanabe Estimates (on “Regular Dissipative Operators”)	90
6.6	Infinitesimal Generators in a General Banach Space	93
7	Abstract Cauchy Problems	95
8	General Second-Order Systems	103
8.1	Introduction to Second-Order Systems	103
8.2	Results for σ_2 V -elliptic	104
8.3	Results for σ_2 H -semielliptic	105

8.4	Stronger Assumptions for σ_2	107
9	Weak Formulations for Second-Order Systems	109
9.1	Model Formulation	109
9.2	Discussion of the Model	113
9.3	Theorems 9.1 and 9.2: Proofs	116
10	Inverse or Parameter Estimation Problems	123
10.1	Approximation and Convergence	126
10.2	Some Further Remarks	134
11	“Weak” or “Variational Form”	137
12	Finite Element Approximations and the Trotter-Kato Theorems	143
12.1	Finite Elements	143
12.2	Trotter-Kato Approximation Theorem	146
13	Delay Systems: Linear and Nonlinear	151
13.1	Linear Delay Systems and Approximation	151
13.2	Modeling of Viral Delays in HIV Infection Dynamics . .	155
13.3	Nonlinear Delay Systems	161
13.4	State Approximation and Convergence for Nonlinear Delay Systems	165
13.5	Fixed Delays versus Distributed Delays	170
13.5.1	First Principles Modeling of Distributed Delays .	173
14	Weak* Convergence and the Prohorov Metric in Inverse Problems	177
14.1	Populations with Aggregate Data, Uncertainty, and PBM	177
14.1.1	Type I: Individual Dynamics/Aggregate Data Inverse Problems	177
14.1.2	Type II: Aggregate Dynamics/Aggregate Data Inverse Problems	178
14.2	A Prohorov Metric Framework for Inverse Problems . .	180
14.3	Metrics on Probability Spaces	182
14.3.1	The Prohorov Metric	183
14.3.2	Robust Statistics	184
14.3.3	The Levy Metric	185
14.3.4	The Bounded Lipschitz Metric	186

14.3.5 Other Metrics	187
14.4 Example 5: The Growth Rate Distribution Model and Inverse Problem in Marine Populations	187
15 The Prohorov Metric in Optimization and Optimal Design Problems	197
15.1 Two Player Min-Max Games with Uncertainty	197
15.1.1 Problem Formulation	198
15.1.2 Theoretical Results	202
15.2 Optimal Design Techniques	205
15.2.1 Optimal Design Formulations	206
15.2.2 Theoretical Summary	209
15.2.3 Design Strategy Examples	210
15.3 Generalized Curves and Relaxed Controls of Variational Theory	211
15.4 Preisach Hysteresis in Smart Materials	214
15.5 NPML and Mixing Distributions in Statistical Estimation	217
16 Control Theory for Distributed Parameter Systems	219
16.1 Motivation	219
16.2 Abstract Formulation	221
16.3 Infinite Dimensional LQR Control: Full State Feedback	223
16.4 The Finite Horizon Control Problem	225
16.5 The Infinite Horizon Control Problem	227
17 Families of Approximate Control Problems	229
17.1 The Finite Horizon Problem: Approximate Control Gains	230
17.2 The Infinite Horizon Problem: Approximate Control Gains	232
17.2.1 Example 6 Again!	237
