

CONTENTS

<i>Preface</i>	xiii
<i>Acknowledgements</i>	xvi
1 Earth and sky	1
1.1 Planet Earth	1
1.2 The Earth's magnetosphere	6
1.3 Aurorae	8
1.4 Visually observing aurorae	10
1.5 Other methods of observing aurorae	16
1.6 Noctilucent clouds	17
1.7 Dates and times in your observation report	17
1.8 A celestial menagerie	19
1.9 Meteors, meteorites and meteor showers	21
1.10 Visually observing meteors	27
1.11 Other methods of observing meteors	30
1.12 Join an astronomical society	31
2 Moon and planet observer's hardware	33
2.1 Optical requirements for Moon and planet observing	34
2.2 What type of telescope is best for Moon and planet observing?	37
2.3 What size of telescope is best for Moon and planet observing?	48
2.4 So, what telescope should I obtain for Moon and planet observing?	50
2.5 Eyepiece characteristics	51
2.6 Specific eyepiece types, Barlow lenses and magnification	53
2.7 Making the best of what you already have	57
2.8 Permanently housing a telescope	63
3 The Solar System framed	67
3.1 Choices	68
3.2 CCD astrocams and digital cameras	68
3.3 The imaging area of a CCD when used with a camera lens or a telescope	75

3.4	Practical photography through the telescope – at the principal focus	78
3.5	Limits on the potential resolution of detail in the image	80
3.6	Enlarging the telescope’s primary image	83
3.7	Is a drive necessary?	91
3.8	Finishing the job	93
4	Stacking up the Solar System	95
4.1	The benefits of stacking selected images	95
4.2	Some general principles about stacking	97
4.3	Manually stacking individual frames	98
4.4	The webcam revolution	101
4.5	Selecting your kit for high-resolution imaging	102
4.6	A moonlit first night	109
4.7	Stacking the images using <i>RegiStax</i>	111
4.8	Targeting an enlarged planetary image on a small CCD	118
4.9	Striving for the best results	119
5	Our Moon	121
5.1	Orbit, phases and eclipses	122
5.2	Lunar occultations	125
5.3	The Moon through binoculars and telescopes	125
5.4	Libration	130
5.5	Lunar co-ordinates and image orientations	131
5.6	Printed lunar atlases	136
5.7	<i>Consolidated Lunar Atlas</i> and space-borne photographs online	137
5.8	Lunar ephemerides	139
5.9	The nature and evolution of the Moon	140
5.10	Lunar chronology – and how to interpret what you see through the telescope	143
5.11	Drawing and photographing the Moon	145
5.12	Transient lunar phenomena	149
5.13	Bogus TLP	153
5.14	TLP observing programme	155
5.15	Lunar research utilising online data	156
6	Mercury and Venus	157
6.1	Stellar and planetary brightnesses	157
6.2	The orbit and phases of Mercury	159

6.3	Seeing Mercury through the telescope	161
6.4	The real planet Mercury	163
6.5	Visually observing and drawing Mercury (and other planets)	167
6.6	Assessing the atmospheric conditions	172
6.7	The orbit and phases of Venus	174
6.8	Seeing Venus through the telescope	175
6.9	Visually observing and drawing Venus	175
6.10	Venus unveiled	181
6.11	Photographing Mercury and Venus	186
6.12	Transits of Mercury and Venus	190
7	Mars	197
7.1	The nature and orbit of Mars	197
7.2	Oppositions, conjunctions, and the path of Mars across the sky	198
7.3	Setting your telescope onto Mars	200
7.4	Mars through the telescope – difficulties and illusions	202
7.5	Visually observing and drawing Mars	207
7.6	Maps of Mars	212
7.7	Some specific short- and long-term changes in Martian features	212
7.8	Mars seen through coloured filters	216
7.9	Photographing Mars	217
7.10	Mars as revealed by the early space probes	218
7.11	The new Mars	223
7.12	Phobos and Deimos	227
8	Jupiter	229
8.1	The Jolly Cream Giant	229
8.2	Jupiter through the telescope	230
8.3	Spacecraft to Jupiter	234
8.4	Jupiter observed by eye and recorded by pencil	237
8.5	Photographing Jupiter	240
8.6	Central meridian timings and strip sketches	244
8.7	Latitude measures	249
8.8	The great orb of Jupiter, its magnetosphere and its radiation belts	253
8.9	Jupiter's main satellites and faint ring	254
8.10	Collision with a comet	260

8.11 A jolly good planet to follow	263
8.12 Tune in to Radio Jupiter	265
9 Saturn, Uranus and Neptune	269
9.1 Saturn in the sky and through the telescope	269
9.2 Visually observing Saturn	277
9.3 Drawing Saturn	281
9.4 Photographing Saturn	283
9.5 Saturn probed	287
9.6 The satellites of Saturn	293
9.7 Titan	295
9.8 Saturn's moons and the amateur astronomer	297
9.9 The discovery of the planet Uranus	298
9.10 Uranus in detail	300
9.11 The satellites of Uranus	302
9.12 Uranus and the amateur astronomer	304
9.13 Neptune emerges from the deep	306
9.14 Neptune probed	307
9.15 Neptune and the amateur astronomer	309
9.16 Planetary occultations	310
10 Small worlds	313
10.1 The Main Belt asteroids	313
10.2 Pluto and the little ice worlds	316
10.3 Asteroid designations	320
10.4 Some useful websites	321
10.5 Telescopes for visually observing asteroids	322
10.6 Binoculars for observing asteroids	323
10.7 Setting your telescope onto a chosen asteroid	326
10.8 Photographing asteroids I – camera and telescope	328
10.9 Photographing asteroids II – calibration frames	334
10.10 Photometry I – taking the picture	340
10.11 Photometry II – obtaining magnitude measures from a CCD image	342
10.12 Photometry III – filters	345
10.13 Photometry IV – light-curves and analysis	346
10.14 Astrometry	349
10.15 Occultations	350
10.16 The <i>Minor Planet Observer</i> software suite	353
10.17 Further work	354

11 Comets	357
11.1 Ghostly visitors	357
11.2 Naming comets	360
11.3 A comet's nucleus, jets and shells	362
11.4 A comet's false nucleus and coma	366
11.5 A comet's tails	369
11.6 Cometary debris	372
11.7 Cometary close encounters	373
11.8 Telescopes and binoculars for observing comets	374
11.9 Wide-field eyepieces	377
11.10 Image characteristics	378
11.11 Useful websites	379
11.12 Locating comets	379
11.13 Observing and drawing comets	380
11.14 Photographing comets I – fixed cameras	388
11.15 Photographing comets II – cameras on driven platforms	389
11.16 Photographing comets III – at a telescope's principal focus	392
11.17 Photographing comets IV – image processing	393
11.18 Photometry of comets	398
11.19 Astrometry of comets	400
11.20 Further work	402
12 Our daytime star	403
12.1 Hot stuff	403
12.2 The solar orb	405
12.3 Integrated (white)-light solar viewing	410
12.4 The solar photosphere and magnetosphere	423
12.5 Sunspots, pores, faculae and plage	429
12.6 Recording the solar-disk details you can see visually	432
12.7 Photographing the Sun in 'white' light	436
12.8 Deriving the positions of features on the Sun from your observations	437
12.9 Measures of solar activity	438
12.10 Observing the Sun in monochromatic light	441
12.11 The chromosphere	444
12.12 Prominences and filaments	446
12.13 The solar corona	449
12.14 The solar wind and solar flares	450
12.15 Solar eclipses	452

<i>Appendix 1: Telescope collimation</i>	457
<i>Appendix 2: Field-testing a telescope's optics</i>	469
<i>Appendix 3: Polar alignment</i>	473
<i>Index</i>	477

The colour plates appear between pages 304 and 305
