

CONTENTS

Preface	xxiii
Preface to the SI Edition	xxvii

Chapter 1 Introduction 3

1.1	Material classes and a brief history of their early development	3
1.1.1	Ceramics	3
1.1.2	Metals	6
1.1.3	Polymers and plastics	9
1.1.4	Composite materials	11
1.2	The development of materials science and engineering	13
1.2.1	The development of the theory of the structure of matter	13
1.2.2	The development of experimental methods to study materials	14
1.2.3	The development of materials by scientific methods and engineering applications	18
1.2.4	An example of material development: high-temperature gas-turbine blades	18
1.2.5	The Discovery of New Nanomaterials: Buckyballs and Carbon Nanotubes	21
1.2.6	Materials science and engineering organizations	22
1.3	Engineering applications of materials: some interesting case studies	23
1.3.1	Thermal protection of reentry vehicles	23
1.3.2	Composite materials for the Boeing 787 Dreamliner	25
1.3.3	Ultra-high-strength polymer fibers	26
1.3.4	A smart metal with a trainable memory: biomedical applications	28
1.4	Materials in engineering design	29
1.5	The contents of this book	30
	Summary	31
	Supplemental reading subjects and authors	32
	Homework: Concept questions	32
	Engineer in training-style questions	33
	Design-related question	35

Chapter 2 Atoms, chemical bonding, material structure, and physical properties 37

2.1	Introduction	37
2.2	Atom electronic structure	38

2.2.1	Atom electron energies	38
2.2.2	Atoms of the periodic table	39
2.2.3	Valence, electronegativity, and atom stability	40
2.3	Vapor, liquid, and solid materials	41
2.3.1	Packing of spherical atoms in solids	42
2.4	Crystal structures and crystallography	44
2.4.1	Crystal structures	45
2.4.2	Crystal planes	48
2.4.3	Planar atom density	51
2.4.4	Crystal directions	53
2.4.5	Linear atom density	54
2.5	Chemical bonding, atom arrangements, and physical properties	55
2.6	Van der Waals bonds	57
2.6.1	Permanent-electric dipole bonds	57
2.6.2	Fluctuating-electric dipole bonds	58
2.6.3	Packing of inert-gas atoms	59
2.6.4	Physical properties of inert-gas ions	59
2.7	Covalent bonds	60
2.7.1	Covalent bonds, atom packing, and crystal structures	61
2.7.2	Physical properties and covalent bonds	61
2.7.3	The structures and properties of allotropic forms of carbon: diamond, graphite, buckeyballs, nanotubes, and graphene	63
2.7.4	Covalent bonding with two types of atoms	64
2.8	Polymers	65
2.8.1	Covalent bonding in polymer molecules	65
2.8.2	Molecular arrangements in thermoplastic polymers	68
2.8.3	Properties of thermoplastic polymers	70
2.8.4	Thermosetting polymers	71
2.8.5	Physical properties of polymers and applications	73
2.9	Metallic bonding	73
2.9.1	Metal atom packing	75
2.9.2	Metal physical properties	75
2.9.3	Metal alloys	76
2.10	Ionic Bonding	76
2.10.1	Atom arrangements with ionic bonding	78
2.10.2	Physical properties and ionic bonding	80
2.10.3	Ceramics	81
2.10.4	Crystalline and amorphous materials	81
2.11	Interatomic potentials	83
2.11.1	Introduction	83

2.11.2	Inert-gas atom potentials	84
2.11.3	Interionic potentials	87
2.11.4	Interatomic potentials and physical properties	88
2.11.5	Models for metallic and covalent bonding	88
	Summary	89
	Supplemental reading subjects and authors	92
	Homework: Concept questions	92
	Engineer in training-style questions	95
	Design-related questions	96
	Problems	97
Appendix 2A	Indices of planes and directions in hexagonal crystals	W-131
Appendix 2B	The Lennard-Jones potential for inert gas atoms	W-132
Appendix 2C	Ionic-crystal separation energy and cohesive energy	W-135

Chapter 3 The structure of real materials 101

3.1	Introduction	101
3.2	Zero-dimensional defects and modifications to materials	102
3.2.1	Point defects in crystals	102
3.2.1.1	Substitutional atoms	102
3.2.1.2	Vacancies	102
3.2.1.3	Interstitial atoms	103
3.2.2	Point defects in glass	104
3.2.3	Zero-dimensional modifications to polymer chains	105
3.3	One-dimensional or linear defects and modifications to materials	106
3.3.1	Linear modifications to polymers	106
3.3.1.1	Side branches	106
3.3.1.2	Copolymers	106
3.3.1.3	Cross-linking of polymers	107
3.3.2	Line defects in crystalline metals	108
3.3.3	Line defects in materials with ionic and covalent bonding	111
3.4	Two-Dimensional defects in materials	112
3.4.1	Surfaces and phase boundaries	112
3.4.2	Grain boundaries in crystalline materials	118
3.4.3	Spherulites in polymers	120
3.4.4	Stacking faults and twin boundaries	121
3.5	Three-dimensional or bulk defects and modifications to materials	122
3.5.1	Three-dimensional or bulk defects and modifications to metals	122
3.5.2	Three-dimensional or bulk defects in ceramics	123
3.5.3	Three-dimensional modifications to polymers	123

3.6	Composite materials	124
3.7	Defects, modifications, and physical properties	126
	Summary	126
	Supplemental reading subjects and authors	128
	Homework: Concept questions	128
	Engineer in training–style questions	129
	Design-related questions	130
	Problems	131
Appendix 3A	Dislocations in FCC crystals	W-141

Chapter 4 Temperature effects on atom arrangements and atom motion

135

4.1	Introduction	135
4.2	Heat and temperature	136
4.2.1	Heat capacity and specific heat	137
4.2.2	Heat capacity and specific heat of polymers	140
4.3	Thermal expansion	141
4.3.1	Thermal expansion of polymers	144
4.3.2	Negative coefficients of thermal expansion	145
4.4	Thermal conductivity	145
4.4.1	Thermal conductivity in ceramics	146
4.4.2	Thermal conductivity in metals	147
4.4.3	Thermal conductivity in semiconductors	148
4.4.4	Thermal conductivity in polymers	149
4.4.5	Thermal conductivity and defects	149
4.5	The mixing of atoms	150
4.5.1	Entropy	151
4.5.2	The Gibbs free energy	155
4.5.3	Equilibrium point defect concentrations in metals and ceramics	157
4.6	Rates of change in materials	160
4.7	Diffusion in metals and ceramics	165
4.7.1	Vacancy diffusion	166
4.7.2	Interstitial atom diffusion	167
4.7.3	Vacancy diffusion rates in metals and ceramics	168
4.7.4	Interstitial diffusion rates in metals and ceramics	170
4.7.5	Diffusion rates at defects in metals and ceramics	170
4.7.6	Analysis of steady-state diffusion	171
4.7.7	Time-dependent diffusion	176

4.8	Mixing, solubility, diffusion, and permeability in polymers	180
4.8.1	Polymer motion in entangled melts	180
4.8.2	Mixing, entropy, and Gibbs free energy for polymer melts	181
4.8.3	Polymer solubility and permeation	183
4.9	What is a catalytic converter?	185
	Summary	186
	Supplemental reading subjects and authors	188
	Homework: Concept questions	188
	Engineer in training–style questions	190
	Design question	191
	Problems	191
Appendix 4A	Heat capacity of ideal gases	W-143
Appendix 4B	Molar heat capacity of solids and liquids	W-144
Appendix 4C	The entropy of mixing B-type atoms into an A-type crystal	W-145
Appendix 4D	Derivation of the equilibrium concentration of substitutional point defects in a crystal	W-147
Appendix 4E	Derivation of Fick's Second law of diffusion	W-148

Chapter 5 Phase transformations and phase diagrams

197

5.1	Introduction	197
5.2	Energy and entropy changes during phase transformations	198
5.3	Phase transformations and phase diagrams in one-component systems	200
5.3.1	Nucleation and growth-phase transformations	203
5.4	The Gibbs phase rule	206
5.5	Equilibrium in two-component systems	207
5.6	Binary equilibrium phase diagrams	208
5.6.1	Continuous-solid and continuous-liquid solutions	208
5.6.2	Two-phase regions of binary-phase diagrams	211
5.6.3	The lever rule	213
5.6.4	Cooling through a two-phase region	215
5.7	Binary eutectic phase diagrams	217
5.7.1	The silver-copper eutectic-phase diagram	217
5.7.2	The lead-tin eutectic-phase diagram	223
5.8	Binary-phase diagrams with invariant reactions	227
5.9	Binary-phase diagrams with compounds	227
5.10	Analyzing complex binary-phase diagrams	231

5.11	Binary-phase diagrams for ceramics	233
5.12	Miscibility gaps in metal and ceramic binary-phase diagrams	235
5.13	Ordering in metal and ceramic binary-phase diagrams	235
5.14	The iron-carbon phase diagram and martensitic phase transformations	236
5.14.1	The iron-carbon phase diagram	236
5.14.2	Time-temperature-transformation diagrams for plain-carbon steel	238
5.15	Reversible martensitic phase transformations	243
5.15.1	The shape-memory effect and training in metal alloys	245
5.16	Shape-memory polymers	246
5.17	Liquid-to-crystal and liquid- to-amorphous material transitions	246
5.18	Phase diagrams for liquid polymer blends	247
5.19	Ternary phase diagrams	249
	Summary	249
	Supplemental reading subjects and authors	251
	Homework: Concept questions	251
	Engineer in training-style questions	253
	Design-related questions	255
	Problems	255
Appendix 5A	The GFE and available work	W-151
Appendix 5B	The thermodynamics and kinetics of nucleation and growth phase transformations	W-151
	5B.1 The thermodynamics of phase transformations	W-151
	5B.2 The thermodynamics of homogeneous nucleation	W-153
	5B.3 Thermodynamics of heterogeneous nucleation	W-156
	5B.4 The kinetics of nucleation and growth transformations	W-157
Appendix 5C	Continuous-solid solution phase diagrams and Gibbs free energy	W-158
Appendix 5D	Eutectic phase diagrams and Gibbs free energy	W-161
Appendix 5E	Phase diagrams with compounds and Gibbs free energy	W-164
Appendix 5F	Miscibility gaps in metal and ceramic binary phase diagrams	W-167
Appendix 5G	Ordering in metal and ceramic binary-phase diagrams	W-169
Appendix 5H	Shape-memory polymers	W-170
	Appendix homework problems	W-171

Chapter 6 Introduction to mechanical properties

261

6.1	Introduction	261
6.2	Stress and strain	262
6.2.1	Tension and Compression	262
6.2.2	Shear	267

6.3	Elastic moduli	267
6.3.1	Anelastic materials	270
6.3.2	Interatomic potentials and elastic moduli	271
6.3.3	Elastic and anelastic strain in rubber	272
6.4	Strain energy	273
6.5	Plastic strain	274
6.5.1	Plastic strain in polymers	275
6.5.2	Plastic strain in glass	276
6.5.3	Plastic strain in crystalline metals and ceramics	277
6.6	Tensile stress-strain diagrams for single crystals and polycrystals	282
6.7	Tensile stress-strain diagrams and mechanical properties for engineering materials	285
6.7.1	Introduction to tensile tests	285
6.7.2	Stress-strain diagrams and material types	286
6.7.3	Yield stress	286
6.7.4	Resilience	290
6.7.4.1	Impact resilience of polymers	292
6.7.5	Strain hardening	292
6.7.6	The ultimate tensile strength	294
6.7.7	Toughness	297
6.7.8	Stress-strain diagrams for polymers	299
6.7.9	Fracture and ductility of smooth tensile specimens	301
6.7.10	The relationship between yield strength and ductility	303
6.7.11	Tensile and compressive strength of brittle ceramic materials	303
6.7.12	Strength tests for brittle materials and composite materials	304
6.8	Superelasticity	306
6.9	Hardness, microhardness, and nanohardness	307
	Summary	309
	Supplemental reading subjects and authors	312
	Homework: Concept questions	312
	Engineer in training-style questions	314
	Problems	316

Chapter 7 Making strong materials

321

7.1	Introduction	321
7.2	Strengthening metals	321
7.2.1	Strain-hardening metals	322
7.2.2	Annealing metals	325
7.2.3	Grain-boundary strengthening of metals	327

7.2.4	Dispersion strengthening	330
7.2.5	Solid solution strengthening	332
7.2.6	Precipitation hardening	334
7.3	Strengthening ceramics	339
7.3.1	Strengthening single crystal ceramics	339
7.3.2	Strengthening polycrystalline ceramics	339
7.3.3	Strengthening amorphous ceramics	342
7.4	Whiskers: nearly perfect single crystals	343
7.5	Carbon nanotubes, graphene, and nanowires	344
7.6	Strengthening thermoplastic polymers	345
7.6.1	Strengthening a specific thermoplastic polymer	345
7.6.1.1	Strengthening thermoplastic polymers by increased molecular mass	345
7.6.1.2	Strengthening thermoplastic polymers by reducing side branches	346
7.6.1.3	Strengthening thermoplastic polymers with crystallinity	346
7.6.1.4	Strengthening thermoplastic polymers by orienting LCMs	346
7.6.1.5	Strengthening and weakening of thermoplastic polymers with blends and alloys	348
7.6.2	Strengthening thermoplastic polymers by mer modification	350
7.6.3	Strength of thermoplastic copolymers	350
7.7	Strength of thermoset polymers	350
7.7.1	Strength of network thermoset polymers	351
7.7.2	Strength of cross-linked thermoset polymers	352
	Summary	353
	Supplemental reading subjects and authors	355
	Homework: Concept questions	355
	Design-related questions	358
	Engineer in training-style questions	358
	Problems	360

Chapter 8 Engineering materials

363

8.1	Metal alloys	363
8.1.1	Treatment of metal alloys	364
8.1.2	Aluminum alloys	364
8.1.3	Copper alloys	368
8.1.4	Iron alloys	371
8.1.4.1	Plain-carbon and alloy steels	371
8.1.4.2	Tool steels	375
8.1.4.3	Stainless steel	376
8.1.4.4	Cast iron	377

8.1.5	Magnesium alloys	379
8.1.6	Superalloys	381
8.1.7	Titanium alloys	383
8.1.8	The specific strength and modulus of structural metals	386
8.1.9	Noble metals	387
8.1.10	Refractory metals	388
8.1.11	Other metals	388
8.2	Ceramics, glass, and glass-ceramics	388
8.3	Polymers	393
8.3.1	Commodity thermoplastic polymers	393
8.3.2	Engineering thermoplastic polymers	396
8.3.3	High-performance thermoplastic polymers	399
8.3.4	Thermosetting polymers	399
8.3.5	Thermosetting elastomers	400
8.3.6	Thermoplastic elastomers	403
8.3.7	Fluoroelastomers	404
8.3.8	Silicones	404
8.3.9	Polyurethane	404
	Summary	406
	Supplemental reading subjects and authors	410
	Homework: Concept questions	410
	Engineer in training-style questions	414
	Problems	416

Chapter 9 Time, temperature, and mechanical properties

419

9.1	Introduction	419
9.2	Elastic modulus and temperature	420
9.3	Plastic strain in liquids and amorphous solids	420
9.4	Creep strain and stress rupture in solids	423
9.4.1	The mechanisms of stage II creep in crystalline metals	430
9.4.2	The mechanisms of stage II creep in crystalline ceramics	435
9.4.3	Deformation-mechanism maps of stage II creep in crystalline metals and ceramics	435
9.4.4	Superplastic strain in metals and ceramics	437
9.4.5	Plastic strain and creep in noncrystalline ceramics	439
9.4.6	Plastic strain, creep, and stress rupture in polymers	439
9.5	Temperature and stress strain curves in metals, polymers, and ceramics	442
9.6	Viscoelastic strain models of elastic and plastic strain	443

9.7 Stress relaxation 446

Summary	449
Supplemental reading subjects and authors	450
Homework: Concept questions	450
Engineer in training-style questions	452
Problems	453

Chapter 10 Oxidation, degradation, corrosion, electroprocessing, batteries, and fuel cells 457

10.1 Introduction 457**10.2 The reaction of metals and ceramics with oxygen 457****10.3 Degradation of polymers 462**

10.3.1 Polymer solvent absorption and permeation	462
10.3.2 Degradation of polymers by irradiation	464

10.4 Electrochemistry fundamentals 465

10.4.1 Standard electrode potentials	466
10.4.2 Standard electrode potentials and Gibbs free energy	469
10.4.3 Electrode potentials and the Nernst equation	471
10.4.4 Rates of electrode change due to electrochemical processes	473

10.5 Corrosion 474

10.5.1 Uniform corrosion	474
10.5.2 Galvanic corrosion	476
10.5.3 Crevice corrosion	478
10.5.4 Pitting corrosion	479
10.5.5 Intergranular corrosion	480
10.5.6 Selective leaching	481
10.5.7 Erosion corrosion	481
10.5.8 Designing to prevent corrosion	481

10.6 Electromachining, electropolishing, and electroplating 483**10.7 Batteries 485****10.8 Fuel cells 486**

Summary	489
Supplemental reading subjects and authors	491
Homework: Concept questions	491
Engineer in training-style questions	492
Problems	493

Chapter 11 Fracture and fatigue

497

-
- 11.1 Introduction 497
 - 11.2 Fracture 498
 - 11.2.1 Theory of brittle fracture 498
 - 11.2.2 Fracture of brittle materials: ceramics, metals, and polymers 502
 - 11.2.3 Fracture with localized surface plastic strain 505
 - 11.2.4 Fracture of metals 506
 - 11.2.5 Fracture of polymers 509
 - 11.2.6 The effect of specimen thickness on the critical stress intensity factor 510
 - 11.2.7 The effect of temperature on K_{Ic} 512
 - 11.2.8 Environmental effects on the fracture of metals, polymers, and ceramics 515
 - 11.2.9 Fracture mechanics and design 516
 - 11.2.10 Nondestructive tests 516
 - 11.2.11 Fracture mechanics and the fracture of smooth tensile test specimens 519
 - 11.3 Fatigue failure 522
 - 11.3.1 Introduction 523
 - 11.3.2 Fatigue tests of smooth metal and polymer specimens 524
 - 11.3.3 Fatigue-crack initiation in metals and polymers 529
 - 11.3.4 Improving fatigue life 531
 - 11.3.5 Fatigue-crack propagation 532
 - 11.3.6 Fatigue-crack-propagation life 537
 - 11.4 Sustained-load crack propagation 539
 - 11.5 Failure statistics 540
 - Summary 543
 - Supplemental reading subjects and authors 545
 - Homework: Concept questions 545
 - Engineer in training–style questions 546
 - Problems 548

Chapter 12 Composite materials

551

-
- 12.1 Introduction 551
 - 12.2 Reinforcement materials 552
 - 12.3 Matrix materials 554
 - 12.4 Analysis of uniaxial continuous-reinforced composites with loads applied parallel to the reinforcement 555
 - 12.5 Analysis of uniaxial continuous-reinforcement composites with loads applied perpendicular to the reinforcement 558

12.6	Electrical and thermal conductivity of composite materials	560
12.7	Composite-material configurations	560
12.8	Analysis of short-fiber composites	563
12.9	Composite failure	569
12.9.1	Axial tensile failure of uniaxial continuous fiber composites	569
12.9.1.1	Brittle fibers and a brittle matrix	569
12.9.1.2	Brittle fibers and a ductile matrix	571
12.9.2	Transverse tensile failure of uniaxial continuous fiber composites	572
12.9.3	Compression failure of uniaxial continuous fiber composites	573
12.9.4	Shear failure of uniaxial continuous fiber composites	575
12.9.5	Failure in short-fiber composites	575
12.9.6	The critical-stress intensity factor for composite materials	575
12.10	Thermal stresses in composite materials	576
12.11	Processing of continuous-fiber composites	579
12.11.1	Processing of uniaxial continuous-fiber composites	580
12.11.2	Processing of woven continuous-fiber composite	581
12.12	Recycling of fiber-reinforced composites	582
12.13	Composites for construction	583
12.13.1	Wood	583
12.13.2	Concrete	584
12.13.3	Asphalt	586
	Summary	587
	Supplemental reading subjects and authors	589
	Homework: Concept questions	589
	Engineer in training-style questions	590
	Problems	592

Chapter 13 Materials processing

597

13.1	Introduction	597
13.2	Processing of metals	598
13.2.1	Deformation processing of metals	598
13.2.2	Cold working of metals	598
13.2.3	Hot working of metals	601
13.2.4	Superplastic forming of metals and ceramics	601
13.2.5	Casting of metals	602
13.2.6	Powder techniques for metals and ceramics	604
13.2.7	Single-crystal growth of metals and ceramics	605
13.2.8	Joining of metals: welding, brazing, and soldering	607

13.3	Processing ceramics	610
13.3.1	Slip processing of ceramics	610
13.3.2	Processing glass and glass-ceramics	612
13.3.3	Joining ceramics	612
13.4	Processing of polymers	614
13.4.1	Deformation processing of thermoplastic polymers	614
13.4.2	Low-temperature forming techniques for thermoplastic polymers	616
13.4.3	Deformation processing of thermoset polymers	617
13.4.4	Casting polymers	618
13.4.5	Joining plastics	618
	Summary	619
	Supplemental reading subjects and authors	621
	Homework: Concept questions	621
	Engineer in training--style questions	622

Chapter 14 Material selection

625

14.1	Materials, Mechanical Properties, and Design	625
14.2	Cost Analysis	626
14.2.1	Material cost and performance	627
14.2.2	Manufacturing cost	630
14.2.3	Other cost	631
14.3	Material selection procedures	632
14.3.1	Material selection for performance per unit of cost	634
14.3.2	Material selection procedures for weight-critical design	636
14.3.3	Material selection for an anchor stem of a total artificial hip replacement	638
14.4	Materials selection for sustainability	641
14.4.1	Sustainable use of iron	642
14.4.2	Sustainable use of nonferrous metals	642
14.4.3	Sustainable use of plastics	642
14.4.4	Sustainable use of ceramics and glass	643
14.4.5	Sustainable use of composite materials	644
14.5	Material databases	645
14.5.1	Graphical material databases	645
14.5.2	Printed material databases	650
14.5.3	Internet material databases	651
	Summary	652
	Supplemental reading subjects and authors	654

Homework: Concept questions	654
Engineer in training-style questions	654
Problems	656

Chapter 15 Experimental methods 659

15.1	Introduction	659
15.2	Crystal-structure analysis by diffraction	659
15.2.1	X-ray diffraction	660
15.2.2	Electron diffraction	671
15.2.3	Neutron diffraction	673
15.2.4	Strain and stress determination in crystals by diffraction	673
15.3	Chemical analysis by x-ray spectroscopy	675
15.3.1	X-ray fluorescence spectroscopy	675
15.3.2	X-ray absorption	677
15.4	Microscopy	680
15.4.1	Optical microscopy	680
15.4.2	Scanning electron microscopy	681
15.4.3	Transmission electron microscopy	683
15.4.4	Scanning tunneling microscopy	685
15.4.5	Atomic force microscopy	687
	Summary	690
	Supplemental reading subjects and authors	691
	Homework: Concept questions	691
	Engineer in training-style questions	693
	Problems	695
	Appendix A, B, and C	698
	References	705
	Index	708

Chapters on the internet web site but not in the printed textbook

W-1

Chapter 16 Electrical properties of materials W-3

16.1	Electrical conductivity and resistivity of materials	W-3
16.2	Electrical conductivity of metals and metal alloys	W-6

16.3	The effect of temperature on electron energies in metals	W-12
16.3.1	Thermionic emission of electrons from metals	W-13
16.4	Superconductors	W-15
16.5	Electrical Conductivity of semiconductors and insulators	W-18
16.5.1	Room-temperature electrical conductivity of intrinsic semiconductors	W-18
16.5.2	The effect of temperature upon the electrical conductivity of intrinsic semiconductors	W-22
16.5.3	Electrical conductivity of insulators	W-22
16.5.4	The electrical conductivity of <i>n</i> -type extrinsic semiconductors	W-22
16.5.5	The electrical conductivity of <i>p</i> -type extrinsic semiconductors	W-26
16.6	Polymer insulators, semiconductors, and conductors	W-29
16.7	Junctions and electronic devices	W-31
16.7.1	Introduction	W-31
16.7.2	Metal-metal junctions	W-31
16.7.3	<i>pn</i> -Junctions	W-33
16.7.4	The diode equation for a <i>pn</i> -junction	W-35
16.7.5	Metal-polymer-metal junctions and electronic devices	W-38
16.8	Dielectric Materials	W-39
16.8.1	Capacitance	W-40
16.8.2	Ferroelectric materials	W-46
16.8.3	Piezoelectric materials	W-49
16.9	Electrical Conductivity in ionic materials	W-51
16.10	Fabrication of crystalline semiconductor devices	W-53
16.11	Present and future electronic systems	W-57
	Summary	W-58
	Supplemental reading subjects and authors	W-60
	Homework: Concept questions	W-60
	Engineer in training–style questions	W-62
	Problems	W-64

Chapter 17 Magnetic materials

W-69

17.1	Introduction	W-69
17.2	Magnetic fields and material response	W-70
17.3	Diamagnetic materials	W-74
17.3.1	Superconductors and diamagnetism	W-76
17.4	Paramagnetism	W-78
17.5	Ferromagnetism	W-80

- 17.6 Ferrimagnetism** W-86
- 17.7 Soft and hard magnetic materials** W-87
- 17.8 Magnetic recording** W-89
- 17.9 Antiferromagnetism** W-90
- 17.10 Magnetoresistance** W-91
 - Summary W-92
 - Supplemental reading subjects and authors W-93
 - Homework: Concept questions W-94
 - Engineer in training–style questions W-94
 - Problems W-96

Chapter 18 Photonic materials

W-101

- 18.1 Introduction** W-101
- 18.2 Electromagnetic radiation in a vacuum** W-102
- 18.3 Reflection, refraction, and absorption in materials** W-104
 - 18.3.1 Fiber-optic cable** W-108
- 18.4 Absorption and chemical bonding** W-110
 - 18.4.1 Color** W-115
 - 18.4.2 X-ray absorption** W-116
 - 18.4.3 Photon absorption and devices** W-117
- 18.5 Photon emission** W-120
 - 18.5.1 X-ray emission** W-121
 - 18.5.2 Emission of electromagnetic radiation and devices: LEDs, OLEDs, and LASERS** W-121
 - Summary W-125
 - Supplemental reading subjects and authors W-126
 - Homework: Concept questions W-126
 - Engineer in training–style questions W-127
 - Problems W-128
