

CONTENTS

Preface	page vii	4.3 Measurement of soil or plant water status	76
Acknowledgements	ix	4.4 Hydraulic flow	81
Symbols	x	4.5 Long-distance transport in the phloem	96
Main abbreviations and acronyms	xvi	4.6 Sample problems	98
 		5 Energy balance and evaporation	99
1 A quantitative approach to plant–environment interactions	1	5.1 Energy balance	99
1.1 Modelling	1	5.2 Evaporation	103
1.2 Use of experiments	6	5.3 Measurement of evaporation rates	110
2 Radiation	9	5.4 Evaporation from plant communities	116
2.1 Introduction	9	5.5 Dew	119
2.2 Radiation laws	10	5.6 Sample problems	121
2.3 Radiation measurement	16	6 Stomata	122
2.4 Radiation in natural environments	20	6.1 Distribution of stomata	122
2.5 Radiation in plant communities	27	6.2 Stomatal mechanics and mechanisms	125
2.6 Radiation distribution within plant canopies	31	6.3 Methods of study	128
2.7 Canopy reflectance and remote sensing	36	6.4 Stomatal response to environment	135
2.8 Direct and subcanopy methods for determining canopy structure	42	6.5 Stomatal resistance in relation to other resistances	146
2.9 Concluding comments	46	6.6 Stomatal function and the control loops	149
2.10 Sample problems	46	6.7 Sample problems	152
3 Heat, mass and momentum transfer	47	7 Photosynthesis and respiration	153
3.1 Measures of concentration	47	7.1 Photosynthesis	153
3.2 Molecular transport processes	48	7.2 Respiration	162
3.3 Convective and turbulent transfer	55	7.3 Measurement and analysis of carbon dioxide exchange	167
3.4 Transfer processes within and above plant canopies	60	7.4 Photosynthetic models	171
3.5 Sample problems	67	7.5 Chlorophyll fluorescence	173
4 Plant water relations	68	7.6 Control of photosynthesis and photosynthetic ‘limitations’	182
4.1 Physical and chemical properties of water	68	7.7 Carbon isotope discrimination	189
4.2 Cell water relations	72	7.8 Response to environment	191
		7.9 Photosynthetic efficiency and productivity	197

7.10	Evolutionary and ecological aspects	205	11.3	Climate change and the 'greenhouse effect'	304
7.11	Sample problems	206	11.4	Atmospheric pollutants	315
8 Light and plant development		207	12 Physiology and crop yield improvement		
8.1	Introduction	207	12.1	Variety improvement	324
8.2	Detection of the signal	209	12.2	Modelling and determination of crop ideotype	332
8.3	Phytochrome control of development	211	12.3	Examples of applications	336
8.4	Physiological responses	214	Appendices		
8.5	The role of plant growth regulators	223	Appendix 1	<i>Units and conversion factors</i>	344
8.6	Sample problem	223	Appendix 2	<i>Mutual diffusion coefficients for binary mixtures containing air or water at 20°C</i>	345
9 Temperature		224	Appendix 3	<i>Some temperature-dependent properties of air and water</i>	346
9.1	Physical basis of the control of tissue temperature	224	Appendix 4	<i>Temperature dependence of air humidity and associated quantities</i>	347
9.2	Physiological effects of temperature	231	Appendix 5	<i>Thermal properties and densities of various materials and tissues at 20°C</i>	349
9.3	Effects of temperature on plant development	236	Appendix 6	<i>Physical constants and other quantities</i>	350
9.4	Temperature extremes	242	Appendix 7	<i>Solar geometry and radiation approximations</i>	351
9.5	Comments on some ecological aspects of temperature adaptation	249	Appendix 8	<i>Measurement of leaf boundary layer conductance</i>	353
9.6	Sample problems	254	Appendix 9	<i>Derivation of Equation (9.9)</i>	355
10 Drought and other abiotic stresses		255	Appendix 10	<i>Answers to sample problems</i>	356
10.1	Plant water deficits and physiological processes	256	References		361
10.2	Drought tolerance	260	Index		396
10.3	Further analysis of water use efficiency	270	11 Other environmental factors: wind, altitude, climate change and atmospheric pollutants		
10.4	Irrigation and irrigation scheduling	278	11.1	Wind	290
10.5	Other abiotic stresses	284	11.2	Altitude	297
