<i>Preface</i>	xi
<i>About the Authors</i>	xiii
1 What is Taste?	1
Four basic tastes, as proposed by Aristotle	5
Taste is complex	7
Most food ingredients are tasteless, odorless, and colorless	7
Variations in odor during fermentation and aging due to changes in molecular weight	10
2% is not a small amount	12
2 The Origins of Taste: Why do we Taste?	15
Sweetness is for identifying energy sources (Carbohydrates)	15
Umami is a tool used to search for proteins	22
Carbohydrates are for sweetness, proteins are for umami, but what are lipids for?	28
Saltiness: the ocean was the source of all life	30
The role of salt in cooking is not merely to provide saltiness	33
The contrast effect	33
The suppression effect	34
Acidity monitors the biological metabolism	34
Bitterness: if it's bitter, spit it out!	37
Some people enjoy bitter tastes	39
The reason we consume caffeine despite its bitterness	40
The olfactory sense is the dominant sensory perception of animals	42
The search for food	42
Avoid danger!	43
Know who it is!	44
Find a mate!	45
References	46

3	Taste is General Science	47
	Taste improves with harmonized combinations	48
	The taste of meals = saltiness + umami + savory flavor	48
	The taste of dessert (and fruit) = sweetness + sourness + sweet odor	49
	Tastes influence odors	50
	Food has to be dissolved for us to taste and chewed to enhance the taste	52
	The main ingredients influence taste and odor	53
	Sound has an influence on taste	55
	Visuals, colors, and food styles	55
	Why does color exist?	57
	The basic structure of pigment: why are there no naturally blue foods?	59
	Perception varies with individual differences and conditions	61
	Differences due to age and sex	61
	Individual variation is also significant	63
	Differences due to race and history	65
	The preference for smells is constantly changing	66
	References	67
4	How do we Smell Odors?	69
	Olfactory receptors are G-protein coupled receptors	69
	G-Receptors differentiate isomers, resulting in different odors	71
	G-Receptors perceive multiple chemical substances	73
	G-Receptors work simply as on/off switches	75
	Depending on the binding affinity to receptors, similar molecules can be recognized as completely different tastes and odors	76
	The broad spectrum of the olfactory sense	77
	The transduction of sensory signals	79
	Olfactory fatigue is also a functional activity for life	80
	The recognition and integration of perceptions	82
	Parts of the brain	82
	Continuous circulations in the loop	83
	G-Receptors can perceive light	85
	Understanding G-receptors can provide many answers	85
	Pheromones are not mysterious substances	89
	References	89

5	What Creates Smell?	91
	Odorous molecules are mainly created by plants	91
	Why do plants produce aroma compounds?	92
	Attracting bacteria, insects, and animals	92
	As a defensive mechanism	94
	Attacking tools	95
	Coincidental byproducts	96
	Animals generally smell odorants, not produce them	97
	Animal-origin raw materials	97
	Unconditional surrender to pheromones	98
	Is body odor a coincidental byproduct?	99
	Most flavors that we enjoy are created by cooking	100
	Flavor production by enzymatic or microbial fermentations	101
	Flavor production by heat processes	104
	Flavor production by pyrolysis: smoke flavor	106
	Compound flavor: creation of new flavors by mixing various odors	107
	References	108
6	Technological Advancements Brought about by the Love of Flavors	109
	Why do people combine flavors?	112
	How many flavors are there in the world and how many ingredients are required to make all of these flavors?	114
	How many odorous chemicals are needed to create a tomato flavor?	116
	Perfumers and flavorists create flavors	119
	Olfactory training: flavorists must first distinguish odorous chemicals before creating compound flavors	120
	Compounding flavors: aromas are completed through imagination	124
	To become a perfumer, a heavy smoking habit and age do not matter	126
	The important factor is harmony	126
	Applications of compound flavors	128
	Types of odorants	128
	Synthetic flavors versus natural flavors: which is safer?	129
	Advantages and limitations of natural flavors	137
	Advantages and limitations of compound flavors	138
	References	139

7	How Flavors Influence us	141
	Brain development began with the olfactory sense	141
	The human olfactory sense is less sensitive and inarticulate	144
	Humans' sense of smell has degenerated greatly	145
	Proust phenomenon: odor-evoked autobiographical memory	146
	Sensorial preference changes destinies	147
	Do silkworms only eat mulberry leaves?	148
	Humans live with smells	149
	Stage of development	149
	What happens if you can no longer feel taste or smell?	150
	Are humans free from pheromones	152
	The healing power of aromas	156
	Aromatherapy	157
	Aromachology	158
	Phytoncide	159
	Is geosmin foul or pleasant?	161
	Multiple chemical sensitivity (mcs): there are people who are really intolerant to odorous chemicals	162
	References	164
8	Taste is Regulated by Flavor, and Flavor is Regulated by the Brain	167
	The sense of smell is directly connected to the limbic system, in other words, to survival and emotion	167
	Neuroplasticity in the brain	169
	Is synesthesia a malfunction or a blessing?	170
	Taste is a typical phenomenon of synesthesia and neuroplasticity	172
	Orbitofrontal cortex: where sight, taste, smell, and touch meet	173
	Taste is a part of pleasure, and that pleasure becomes a part of taste	174
	Experience affects taste: familiar foods are preferred	176
	The feeling of disgust can be acquired through learning	177
	Taste is affected by temperature	178
	Price: expectation affects the taste	179
	Prejudices are effective at distorting perceived senses	180
	Even the data from an expert research firm cannot promise success in sales	181
	Sensorial perception is an illusion	183
	Taste and aroma do not exist	185

A good product image makes it taste better	185
References	187
9 The Future of Taste and Aroma	189
Raw ingredient resources gradually become simplified and their original aromas disappear	189
More scientific technologies will be incorporated into the culinary arts	190
What is the difference between cooking and the processing of foods?	192
Aroma-releasing television or movies	194
Is the taste of processed foods inferior to that of natural foods?	196
Is it true that obsessions with flavors and seasonings have decreased?	199
Do technological developments of taste modifications induce obesity or become a key solution to the problem?	201
Technology of satiety: technology of cognitive science for taste and olfactory senses is the technology of the future	202
Satiety control	203
The era of supernormal stimuli	205
References	206
10 Concluding Remarks	207
References	211
