

Contents

1	Laws of thermodynamics	1
1.1	First and second laws of thermodynamics	1
1.2	Combined law of thermodynamics and equilibrium conditions	3
1.3	Stability at equilibrium and property anomaly	7
1.4	Gibbs–Duhem equation	11
	Exercises	12
2	Gibbs energy function	15
2.1	Phases with fixed compositions	18
2.2	Phases with variable compositions: random solutions	25
2.2.1	Random solutions	28
2.2.2	Binary random solutions	29
2.2.3	Ternary random solutions	33
2.2.4	Multi-component random solutions	36
2.3	Phases with variable compositions: solutions with ordering	36
2.3.1	Solutions with short-range ordering	36
2.3.2	Solutions with long-range ordering	40
2.3.3	Solutions with both short-range and long-range ordering	43
2.3.4	Solutions with charged species	43
2.4	Polymer solutions and polymer blends	43
2.5	Elastic, magnetic, and electric contributions to the free energy	45
	Exercises	48
3	Phase equilibria in heterogeneous systems	52
3.1	General condition for equilibrium	52
3.2	Gibbs phase rule	54
3.3	Potential phase diagrams	55
3.3.1	Potential phase diagrams of one-component systems	56
3.3.2	Potential phase diagrams of two-component systems	60
3.3.3	Sectioning of potential phase diagrams	62
3.4	Molar phase diagrams	65
3.4.1	Tie-lines and lever rule	65
3.4.2	Phase diagrams with both potential and molar quantities	66

3.4.3	Phase diagrams with only molar quantities	73
3.4.4	Projection and sectioning of phase diagrams with potential and molar quantities	75
	Exercises	81
4	Experimental data for thermodynamic modeling	94
4.1	Phase equilibrium data	94
4.1.1	Equilibrated materials	94
4.1.2	Diffusion couples/multiples	96
4.1.3	Additional methods	97
4.2	Thermodynamic data	98
4.2.1	Solution calorimetry	98
4.2.2	Combustion, direct reaction, and heat capacity calorimetry	99
4.2.3	Vapor pressure method	99
	Exercises	100
5	First-principles calculations and theory	104
5.1	Nickel as the prototype	105
5.1.1	Helmholtz energy and quasi-harmonic approximation	105
5.1.2	Volume, entropy, enthalpy, thermal expansion, bulk modulus, and heat capacity	110
5.1.3	Formation enthalpy of Ni_3Al	113
5.2	First-principles formulation of thermodynamics	114
5.2.1	Helmholtz energy	114
5.2.2	Mermin statistics for the thermal electronic contribution	115
5.2.3	Vibrational contribution by phonon theory	116
5.2.4	Debye–Grüneisen approximation to the vibrational contribution	117
5.2.5	System with multiple microstates (MMS model)	119
5.3	Quantum theory for the motion of electrons	120
5.3.1	Schrödinger equation	120
5.3.2	Born–Oppenheimer approximation	121
5.3.3	Hartree–Fock approximation to solve the Schrödinger equation	122
5.3.4	Density functional theory (DFT) and zero temperature Kohn–Sham equations	124
5.4	Lattice dynamics	127
5.4.1	Quantum theory for motion of atomic nuclei	127
5.4.2	Normal coordinates, eigenenergies, and phonons	128
5.4.3	Dynamical matrix and phonon mode	131
5.4.4	Linear-response method versus supercell method	133
5.5	First-principles approaches to disordered alloys	135
5.5.1	Cluster expansions	136
5.5.2	Special quasi-random structures	137
5.5.3	Phonon calculations for SQSs	139
	Exercises	140

6	CALPHAD modeling of thermodynamics	150
6.1	Importance of lattice stability	151
6.2	Modeling of pure elements	156
6.3	Modeling of stoichiometric phases	157
6.4	Modeling of random solution phases	158
6.5	Modeling of solution phases with long-range ordering	160
6.6	Modeling of magnetic and electric polarizations	164
7	Applications to chemical reactions	165
7.1	Internal process and differential and integrated driving forces	165
7.2	Ellingham diagram and buffered systems	167
7.3	Trends of entropies of reactions	171
7.4	Maximum reaction rate and chemical transport reactions	172
	Exercises	176
8	Applications to electrochemical systems	182
8.1	Electrolyte reactions and electrochemical reactions	182
8.2	Concentrations, activities, and reference states of electrolyte species	184
8.3	Electrochemical cells and half-cell potentials	185
8.3.1	Electrochemical cells	185
8.3.2	Half-cell potentials	188
8.4	Aqueous solution and Pourbaix diagram	191
8.5	Application examples	196
8.5.1	Metastability and passivation	196
8.5.2	Galvanic protection	198
8.5.3	Fuel cells	199
8.5.4	Ion transport membranes	200
8.5.5	Electrical batteries	200
	Exercises	203
9	Critical phenomena, thermal expansion, and Materials Genome®	206
9.1	MMS model applied to thermal expansion	206
9.2	Application to cerium	208
9.3	Application to Fe ₃ Pt	215
9.4	Concept of Materials Genome®	219
	<i>Appendix A: YPHON</i>	221
	<i>Appendix B: SQS templates</i>	231
