## Part I Introductory Topics

<b>1 Elastic Behavior of Solids</b>	<b>3</b>
1.1 The stress tensor	3
1.2 The strain tensor	4
1.3 Hooke's law	5
1.4 The energy density	6
1.5 Elastic moduli of cubic and hexagonal systems	7
1.6 Distortions of a cubic crystal	9
1.7 Elastic waves	10
1.8 Waves in a cubic crystal	12
1.9 Isotropic media	14
1.10 Viscosity in solids: internal friction	16
1.11 Measuring elastic constants	17
Supplementary Reading	18
Problems	18
<b>2 Electric Behavior of Insulators</b>	<b>21</b>
2.1 The potential from a distribution of dipoles: the polarization	21
2.2 The local electric field	24
2.3 The dielectric constant	27
2.4 Orientational polarization	30
2.5 Dielectric relaxation	32
Supplementary Reading	33
Problems	33
<b>3 Metals and the Drude–Lorentz Model</b>	<b>34</b>
3.1 Ohm's law	34
3.2 The Hall effect	36
3.3 Frequency-dependent conductivity	38
3.4 Dielectric constant of a metal	38
3.5 Dielectric constant of an insulator	40
3.6 A metal in a constant magnetic field and an oscillatory electric field	42
3.7 Thermal conductivity in a metal	44
3.8 Thermoelectric effect	45
Supplementary Reading	45
Problems	46

<b>4</b>	<b>Elementary Theories of the Thermal Properties of Solids</b>	<b>48</b>
4.1	The equipartition law for free and bound particles	49
4.2	The lattice heat capacity at low temperatures: the Einstein model	50
4.3	The Debye model	53
	Problems	58
<b>5</b>	<b>Elementary Theories of Magnetism</b>	<b>59</b>
5.1	Langevin diamagnetism	60
5.2	Langevin paramagnetism	62
5.3	Quantum theory of magnetism	63
5.4	Quantum theory of non-interacting spins	64
5.5	Adiabatic demagnetization	66
5.6	Chemical bonding, Hund's rules, and magnetic ions	67
5.7	Magnetic moments of 4f and 3d ions	69
	Further Reading	70
	Problems	70
<b>6</b>	<b>The Non-interacting Fermi Gas</b>	<b>71</b>
6.1	The quantum mechanics of non-interacting electrons in a box	71
6.2	The non-interacting Fermi gas at absolute zero	74
6.3	Fermi–Dirac statistics	76
6.4	Evaluating integrals involving the Fermi distribution function	80
6.5	The temperature dependence of the chemical potential	81
6.6	Energy of an ideal Fermi gas as a function of temperature	82
6.7	The paramagnetic susceptibility of a Fermi gas	84
6.8	Qualitative discussion of the behavior of a Fermi gas	85
	Problems	86
<b>7</b>	<b>Elementary Theories of Crystal Bonding</b>	<b>87</b>
7.1	Classification of bonds	87
7.2	The van der Waals bond: rare gas solids	87
7.3	The ionic bond: alkali halide solids	91
7.4	The directed covalent bond: Pauling orbitals	93
	7.4.1 Diamond-like structures	94
	7.4.2 Graphite	97
7.5	The alkali metal bond: the Wigner–Seitz model	99
7.6	Atomic radii	100
	Additional Reading	103
	Problems	103

**Part II Crystal Structure and its Determination**

<b>8 Lattices and Crystal Structures</b>	107
8.1 The space lattice	107
8.2 The basis	108
8.3 Point groups in two dimensions	108
8.4 Bravais lattices in two dimensions	110
8.5 Space groups in two dimensions	111
8.6 Point groups in three dimensions	113
8.7 Bravais lattices in three dimensions	118
8.8 Crystal systems	120
8.9 Space groups in three dimensions	120
8.10 Common crystal structures	120
8.11 Miller indices	125
8.12 Wigner–Seitz polyhedra	126
8.13 Coordination polyhedra	127
<b>9 X-ray Diffraction</b>	129
9.1 Bragg’s law	129
9.2 The Laue equations	130
9.3 The reciprocal lattice	132
9.4 Relating the Laue equations to Bragg’s law	135
9.5 The Ewald construction	135
9.6 The Brillouin zone	136
9.7 The geometrical structure factor	137
9.8 The atomic scattering factor	137
9.9 The Debye–Waller factor	139
9.10 Sources of X-rays	139
9.11 Experimental methods to study X-ray diffraction	140
9.11.1 The rotating crystal method	140
9.11.2 The powder method	141
9.11.3 The Laue method	142
Additional Reading	143
Problems	143
Appendix 9A: Evaluating lattice sums by the Ewald method	144

**Part III Electronic Structure of Periodic Solids**

<b>10 Electrons in a Periodic Solid</b>	151
10.1 The crystal potential	151
10.2 Wave function of an electron in a periodic potential	152

10.3	Properties of Bloch functions	153
10.3.1	Orthonormality	154
10.3.2	Periodicity in $k$ -space; energy bands	154
10.3.3	The momentum operator and quasi-momentum	155
10.3.4	The position operator	156
10.3.5	The velocity operator	158
10.3.6	Effect of an external force	158
10.3.7	Scattering among Bloch states	159
10.4	Dispersion near a band edge	159
10.5	Electrons and holes	161
10.6	Brillouin zones	163
10.7	Wannier functions	164
10.8	The Kronig–Penney model	165
	Additional Reading	167
	Problems	167
<b>11</b>	<b>The Nearly Free Electron, OPW, Pseudopotential, and Tight Binding Methods</b>	<b>168</b>
11.1	The nearly free electron model	168
11.1.1	The empty lattice in one dimension	168
11.1.2	The nearly free electron model in one dimension	169
11.1.3	The nearly free electron model in two dimensions	174
11.1.4	The nearly free electron model in three dimensions	178
11.2	The orthogonalized plane wave method	180
11.3	The pseudopotential method	183
11.4	The tight binding approximation	184
11.4.1	The tight binding approximation for $s$ electrons	186
11.4.2	The tight binding approximation for the case $l > 0$	190
11.4.3	The tight binding approximation for the case $l > 0$ together with a basis	191
	Further Reading	192
	Problems	192
<b>12</b>	<b>The Parameterization of Band Structures: Applications to Semiconductors</b>	<b>194</b>
12.1	The $k$ - $p$ method for diamond-like materials at the zone center	194
12.1.1	Spin–orbit coupling in atoms	194
12.1.2	Including spin in atomic $s$ and $p$ states	195
12.1.3	The $k$ - $p$ theory with spin	197
12.1.4	The symmetry of states in cubic crystals at the zone center	198
12.1.5	Basis functions for electrons in diamond-like materials at $\Gamma$	200
12.1.6	Constructing the Hamiltonian matrix	202
12.1.7	Calculating the dispersion	205
12.2	Inverted band structures; $\alpha$ Sn	207
12.3	The Slater–Koster method for diamond-like structures	210
	Further Reading	214
	Problems	215

<b>13 Augmented Plane Wave and Green's Function Methods</b>	<b>216</b>
13.1 The augmented plane wave (APW) method	216
13.2 The Green's function method	221
13.3 More powerful approaches: linearized variational methods	232
Additional Reading	237
<b>Part IV Electron–Electron Interaction</b>	
<b>14 The Self-consistent Dielectric Function</b>	<b>241</b>
14.1 The self-consistent potential method for a uniform electron system	241
14.2 Applications of the dielectric function formalism	244
14.2.1 Static screening; the Thomas–Fermi limit	244
14.2.2 Plasma oscillations	247
14.2.3 Zero sound	249
14.2.4 The Kohn effect	250
Additional Reading	252
Problems	252
Appendix 14A: The self-consistent potential method for the periodic system	253
<b>15 Hartree–Fock and Density Functional Theory</b>	<b>257</b>
15.1 The Hartree and Hartree–Fock approximations	258
15.1.1 The Hartree approximation	258
15.1.2 The Hartree–Fock approximation	262
15.1.3 The exchange energy of a uniform electron liquid	264
15.2 Density functional theory (DFT)	266
15.2.1 Local density theory	266
15.2.2 Potential energy landscape and the elastic constants of molecules	268
15.2.3 The Hohenberg–Kohn theorem	269
15.2.4 Application of density functional theory; Kohn–Sham theory	272
15.3 Alternative strategies based on density functional theory	276
15.3.1 The Hartree–Fock–Kohn–Sham (HFKS) approximation	276
15.3.2 The screened exchange approximation	276
15.3.3 Excited states	277
Further Reading	278
Problems	279
Appendix 15A: Multiple scattering theory	279
15A.1 Solution for a model potential	280
15A.2 Relating multiple scattering theory to the Kohn–Rostoker Green's function method	282
Appendix 15B: The uniform electron liquid	283
15B.1 The Hellman–Feynman theorem	284
15B.2 The Coulomb interaction in terms of the number operator	286
15B.3 Linear response and the response function	287
15B.4 Relating the response function to the dielectric function	290
15B.5 Relating the dielectric function to the ground state energy	291
15B.6 The ground state energy from the SCF dielectric function	292

**Part V Lattice Dynamics**

<b>16 Harmonic Lattice Dynamics: Classical and Quantum</b>	297
16.1 The 1d lattice	297
16.2 The 1d lattice with more than one atom per unit cell	301
16.3 Representing the lattice potential in 3d	305
16.4 Classical theory of the harmonic lattice in 3d	306
16.4.1 Normal modes and the dynamical matrix	306
16.4.2 Orthonormality and completeness relations	308
16.4.3 Lagrangian and Hamiltonian formulation	310
16.5 Quantization of lattice vibrations	312
16.6 Inelastic neutron scattering	314
16.7 Raman scattering	316
16.8 Calculating phonon dispersion relations from first principles	317
16.8.1 The supercell approach	318
Additional Reading	321
Problems	321
Appendix 16A: Calculating the phonon spectrum for all wave vectors	322
<b>17 Thermal Expansion, Phonon–Phonon Interactions, and Heat Transport</b>	328
17.1 Thermal expansion; the Gruneisen model	328
17.2 The linear term in the high temperature specific heat	332
17.2.1 The heat capacity of a single anharmonic oscillator	332
17.2.2 The linear term in the heat capacity of a lattice	333
17.3 Phonon–phonon interactions	337
17.4 The phonon Boltzmann transport equation	341
17.5 The thermal conductivity in dielectric materials	344
17.6 Second sound	347
Additional Reading	348

**Part VI Electron Transport and Conduction Electron Dynamics**

<b>18 Motion of Electrons and Holes in External Electric and Magnetic Fields</b>	351
18.1 Incorporating external electromagnetic fields; gauge invariance	351
18.2 Effect of external magnetic and electric fields on Bloch functions	352
18.3 Quasiclassical equation of motion	355
18.4 Orbits in a magnetic field	356
18.5 Orbit quantization in a magnetic field	358
18.6 Magnetic breakdown	361
Additional Reading	362
Problems	362
Appendix 18A: Zener breakdown	363

<b>19 Electronic Transport Properties Governed by Static Scattering Centers</b>	<b>369</b>
19.1 The semi-classical approach: the distribution function	369
19.2 The Boltzmann equation	370
19.2.1 Evaluating the collision integral	371
19.2.2 The linearized Boltzmann equation	372
19.2.3 The relaxation time approximation	373
19.3 Electrical conductivity	374
19.4 Transport in the presence of electric fields and temperature gradients	375
19.5 Thermal conductivity	377
19.6 Thermoelectric effects	378
19.6.1 The Seebeck effect	378
19.6.2 The Peltier effect	378
19.7 Calculating thermoelectric coefficients	379
19.8 Magnetoresistance and the Hall effect	381
19.9 A two-band model	382
19.10 Calculation of the relaxation time	385
19.11 Limitations of the semi-classical theory	387
19.12 Time-dependent external fields; the Chambers path integral method	391
19.13 Collective excitations	392
Additional Reading	393
Problems	394
<b>20 Measuring the Electronic Energy Spectrum On and Off the Fermi Surface</b>	<b>396</b>
20.1 Determining the Fermi surface	397
20.1.1 The Lifshitz–Kosevich equation for the dHvA effect	397
20.1.2 Experimental techniques to measure the dHvA effect	401
20.1.3 Inversion of dHvA data and parameterization of the Fermi surface	403
20.1.4 Band structure based parameterization of the Fermi surface	411
20.1.5 Other methods to obtain Fermi surface information	413
20.2 Measuring the electronic excitation spectrum: ARPES and IPS	415
20.2.1 Analysis of ARPES data	416
20.2.2 Modeling finite lifetime effects below the Fermi energy	418
20.2.3 Inverse photo-emission spectroscopy	419
Additional Reading	420
<b>21 The Interacting System of Metallic Electrons and Phonons</b>	<b>421</b>
21.1 The dielectric function in the presence of a deformable positive background	422
21.2 Limiting forms; longitudinal sound	426
21.3 Phonon mediated electron–electron interactions	427
21.4 Formal theory of the electron–phonon matrix element	432
21.5 The phonon contribution to the low temperature electrical resistance	434
Additional Reading	436
Problem	436

Appendix 21A: The attenuation of sound by conduction electrons	436
21A.1 Longitudinal waves	441
21A.2 Transverse waves	443
<b>Part VII Semiconductors</b>	
<b>22 Homogeneous Semiconductors</b>	447
22.1 Model band structures	447
22.2 Parabolic bands	448
22.3 Carrier densities and densities of states	449
22.4 Band properties in some specific materials	451
22.5 Holes in Si and Ge	452
22.6 Impurity states	454
22.7 Calculating the occupancy of donors and acceptors	456
22.8 Carrier concentrations in the presence of donors and acceptors	458
22.8.1 High temperatures and low doping: the intrinsic regime	459
22.8.2 Intermediate temperatures and small charge imbalance: $\mu \cong \mu_i$	459
22.8.3 Low temperatures	460
22.8.4 Very low temperatures	461
22.9 Impurity band conduction	463
22.10 Summary of the qualitative behavior on doping	463
Additional Reading	464
Problems	465
<b>23 Inhomogeneous Semiconductors</b>	466
23.1 The p–n junction in equilibrium	466
23.2 The p–n junction in the presence of an external electric field	470
23.3 A more detailed theory of the p–n junction	472
23.4 A survey of semiconductor devices	477
23.4.1 The diode rectifier	477
23.4.2 The p–n–p junction transistor	478
23.4.3 The tunnel diode	479
23.4.4 The junction laser	481
23.4.5 The Zener diode	481
23.4.6 The field effect transistor	482
23.4.7 The MOSFET	484
Additional Reading	486
<b>Part VIII Electric and Magnetic Properties of Insulators</b>	
<b>24 Electric and Magnetic Susceptibilities</b>	489
24.1 The static ionic polarizability	490

24.2	Electronic polarizability of atoms and molecules	491
24.3	The magnetic polarizability of atoms and molecules	496
	Additional Reading	500
<b>25</b>	<b>Piezoelectricity, Pyroelectricity, and Ferroelectricity</b>	<b>501</b>
25.1	Ferroelectricity and pyroelectricity	501
25.2	Landau theory of second-order ferroelectric transitions	502
25.3	The discontinuous ferroelectric transition: the first-order transition	504
25.4	The effect of an applied electric field on a ferroelectric; the susceptibility	507
25.5	Piezoelectricity	508
	Additional Reading	511
	Problem	512
	Appendix 25A: Piezoelectric transducers	512
 <b>Part IX Magnetism</b>		
<b>26</b>	<b>Ferromagnetism and Antiferromagnetism</b>	<b>519</b>
26.1	A survey of magnetic properties	519
26.1.1	Ferromagnetism	521
26.1.2	Antiferromagnetism	522
26.1.3	Ferrimagnetism	522
26.1.4	Complex structures	523
26.2	Density functional theory of band magnetism	525
26.3	The Landau model of ferromagnetism	526
26.4	The Weiss model of ferromagnetism	530
26.5	Anisotropy energy	532
26.6	The gradient energy	534
26.7	Surface tension of a domain wall	535
26.8	Ferromagnetic domains	537
26.9	Total magnetic free energy of a body	538
26.10	Single domain particles	539
26.11	The magnetization curve of an easy axis uniaxial ferromagnet	540
26.12	Measuring the magnetization	542
	Additional Reading	544
	Problems	545
<b>27</b>	<b>Dynamic Properties of Magnetic Materials</b>	<b>546</b>
27.1	The Landau–Lifshitz equation	546
27.2	Ferromagnetic resonance	547
27.3	Magnetic relaxation	550
27.4	Spin wave resonance	551
27.5	Antiferromagnetic resonance	552

xviii *Contents*

27.6	Thermodynamic properties	554
27.7	The microscopic theory of magnons	555
27.8	Micromagnetics	557
27.8.1	Equilibrium magnetization of an arbitrarily shaped particle	557
27.8.2	The dynamic magnetic response in the linear regime	559
27.8.3	The direct approach	561
	Additional Reading	562
	Problems	562
	Appendix 27A: Magnetostatic modes	562
27A.1	Damon and Eshbach theory of spin waves in a platelet	562
27A.2	Adding exchange	568
<b>28</b>	<b>Magnetic Resonance</b>	<b>570</b>
28.1	Electron spin resonance (ESR) and nuclear magnetic resonance (NMR)	570
28.2	Relaxation effects	575
28.3	Spin echoes	576
28.4	Nuclear quadrupole resonance	579
28.5	The quantum mechanical expression for energy dissipation	584
28.6	The chemical and Knight shifts	585
	Further Reading	587
	Appendix 28A: Dipolar broadening	587
	Appendix 28B: Microscopic theory of spin–lattice relaxation; the Korringa relation	593
28B.1	Nuclear Zeeman level transitions induced by electrons	593
28B.2	Formal expression for the spin–lattice relaxation time	594
28B.3	Evaluating $T_1$ for conduction electrons; the Korringa relation	597
<b>Part X Optical Properties</b>		
<b>29</b>	<b>Optical Responses</b>	<b>601</b>
29.1	The matrix element for optical absorption spectra	601
29.2	Critical points in the optical absorption	603
29.3	The frequency-dependent susceptibility	606
29.4	Some analytic properties of the susceptibility	608
29.5	The Kramers–Kronig relations	609
29.6	Some examples of optical absorption spectra	611
	Additional Reading	611
	Problems	612
<b>30</b>	<b>Polaritons, Excitons, and Plasmons</b>	<b>613</b>
30.1	The optical phonon–polariton	613
30.2	Excitons	615
30.2.1	Wannier excitons	616
30.2.2	The Frenkel exciton	618

30.3	The exciton–polariton	620
30.4	Plasmons	620
30.5	Surface polaritons	621
	Additional Reading	623
	Problems	623
<b>31</b>	<b>Behavior Under Intense Illumination: NLO, the e–h Liquid and Excitonic BEC</b>	<b>625</b>
31.1	The nonlinear susceptibility	625
31.2	Effects of $\chi^{(2)}$ and $\chi^{(3)}$ on harmonic fields	626
31.3	Collective effects in semiconductors under intense illumination	629
31.4	The electron–hole liquid	630
31.5	Bose condensation in an ideal gas	635
31.6	The weakly interacting Bose gas	637
31.7	The weakly interacting Bose gas for non-zero temperatures	642
31.8	The Gross–Pitaevskii equation	643
31.9	Polaritons in a 2d photonic cavity	644
31.10	BEC of exciton–polaritons in two dimensions	646
	Additional Reading	648
 <b>Part XI Superconductivity and Superfluidity</b>		
<b>32</b>	<b>A Phenomenological Theory of Superconductivity: The London Equations</b>	<b>651</b>
32.1	The superconducting state	651
32.2	The London equations	653
32.3	Thermodynamics of a type I superconductor	657
32.4	The intermediate state	659
32.5	Surface energy between a normal and a superconducting metal	661
32.6	Quantized vorticity	662
32.7	Type II superconductivity	667
32.8	Superconducting magnets	669
	Additional Reading	669
<b>33</b>	<b>A Phenomenological Theory of Superconductivity: The Ginzburg–Landau Theory and the Josephson Effects</b>	<b>671</b>
33.1	Ginzburg–Landau theory	671
33.1.1	Basic equations	671
33.1.2	Gauge invariance	673
33.2	Boundaries and boundary conditions	674
33.2.1	The pinned boundary and the coherence length	674
33.2.2	The London equation and the penetration depth	675
33.2.3	The normal-metal/superconductor phase boundary; the G–L surface tension	676
33.2.4	Superconductors in contact when a current is present	680

33.3	The upper critical field and the phase diagram of a type II superconductor	681
33.4	The Josephson effects	684
33.4.1	The Josephson equations	684
33.4.2	Magnetic field effects: the two-junction SQUID	686
33.4.3	The extended Josephson junction	689
	Additional Reading	690
	Problem	690
<b>34</b>	<b>The Microscopic Theory of Superconductivity: Cooper Pairing and the Bardeen–Cooper–Schrieffer Theory</b>	<b>691</b>
34.1	Pairing of two electrons above a filled Fermi sea	691
34.2	The Bardeen–Cooper–Schrieffer superconducting ground state	695
	Additional Reading	704
	Problem	704
	Appendix 34A: Some calculations involving the BCS wave function	704
<b>35</b>	<b>Elementary Excitations and the Thermodynamic Properties of Superconductors</b>	<b>708</b>
35.1	The Bogoliubov–Valatin transformation	708
35.2	Thermodynamic properties	713
35.3	The pair amplitude and the order parameter	717
	Additional Reading	718
<b>36</b>	<b>Superfluid <math>^4\text{He}</math></b>	<b>719</b>
36.1	Landau’s phenomenological model for $^4\text{He}$	719
36.2	Superfluidity	722
36.3	The two-fluid model	723
36.4	The thermo-mechanical effect	724
36.5	Hydrodynamics of superfluids and sound propagation	726
36.5.1	Second sound	727
36.5.2	First sound and the equations of motion	728
36.5.3	Fourth sound	729
36.6	The Landau–Ginzburg theory of $^4\text{He}$	731
36.7	Quantized vorticity	733
	Problem	734
	Additional Reading	734
<b>37</b>	<b>Landau’s Theory of a Fermi Liquid</b>	<b>735</b>
37.1	Equilibrium properties	735
37.1.1	The challenge	735
37.1.2	Basic ideas	735
37.1.3	The quasiparticle interaction function	737
37.1.4	Sum rules	739
37.2	Collisionless collective modes	743

37.2.1	The kinetic equation	743
37.2.2	Collisionless longitudinal zero sound	745
37.2.3	Collisionless transverse zero sound	746
	Additional Reading	748
	Problems	749
	Appendix 37A: Collisionless spin waves in $^3\text{He}$	749
<b>38</b>	<b>Superfluid <math>^3\text{He}</math></b>	<b>754</b>
38.1	Basic ideas	754
38.2	The generalized order parameter of a superfluid	755
38.3	Rotation properties of the order parameter	758
38.4	Ginzburg–Landau theory of the superfluid phases of $^3\text{He}$	760
38.5	Minimization of the free energy for an $l = 1, s = 1$ superfluid	763
38.6	Anisotropy of the energy gap in an $l = 1, s = 1$ superfluid; order parameter of $^3\text{He}$	768
	Additional Reading	769
	Problem	770
 <b>Part XII Disordered Materials</b>		
<b>39</b>	<b>Alloys</b>	<b>773</b>
39.1	Phase equilibrium	773
39.1.1	Phases in contact: the Gibbs phase rule	773
39.1.2	Binary mixtures	776
39.1.3	The chemical potential of a dilute alloy	777
39.1.4	Characteristic binary phase diagrams	779
39.1.5	Examples of phase diagrams	781
39.2	Order–disorder transitions	784
39.3	The isolated charged impurity: the Friedel sum rule	785
39.4	The electronic structure of alloys	790
39.4.1	The virtual crystal approximation	790
39.4.2	The average T-matrix approximation (ATA)	791
39.4.3	The coherent potential approximation (CPA)	792
39.4.4	The supercell approach	794
	Additional Reading	795
	Problem	796
<b>40</b>	<b>Defects and Diffusion in Crystalline Solids</b>	<b>797</b>
40.1	Point defects	797
40.2	Concentration of point defects	798
40.3	Point defects in lattices with more than one species	799
40.4	Diffusion: microscopic theory	801
40.5	Diffusion: macroscopic theory	803

40.6	Temperature dependence of the diffusion constant	805
40.7	Ionic conduction	805
40.8	Color centers	807
40.8.1	The F center: a vacancy bound electron	807
40.8.2	Additional color centers	809
	Further Reading	810
<b>41</b>	<b>Dislocations and Grain Boundaries</b>	<b>811</b>
41.1	The edge dislocation	811
41.2	The screw dislocation	813
41.3	The continuum theory of the dislocation displacement field	813
41.3.1	Continuum elasticity theory of the isolated screw dislocation	816
41.3.2	Continuum elasticity theory of the isolated edge dislocation	817
41.4	Grain boundaries	819
	Additional Reading	820
	Problems	820
<b>42</b>	<b>Quantum Theory of Electrical Transport in Dilute Alloys</b>	<b>821</b>
42.1	The vector potential as a time-dependent perturbation	821
42.2	Relation between the current density and the vector potential	823
42.3	Case of a uniform electric field: the local conductivity	824
42.4	A non-local model	826
42.5	A free electron density matrix with scattering: the Bardeen ansatz	828
42.6	The Chambers path integral	829
	Additional Reading	831
	Problem	831
	Appendix 42A: Zero-frequency response; Landau diamagnetism	832
<b>43</b>	<b>Electrical Transport in Highly Disordered Media: Localization/Interaction Effects</b>	<b>835</b>
43.1	Temperature dependence of the electrical resistivity of a highly doped semiconductor: strong localization	835
43.2	Temperature dependence of the electrical resistivity of a disordered metal and an alloy: weak localization	837
43.3	Electrical transport via hopping; strong localization	838
43.4	Weak localization	842
43.5	Magnetoresistance and the Aharonov–Bohm effect	845
43.6	The experiment of Yu. Sharvin and D. Sharvin	848
43.7	Quantization effects in mesoscopic systems	849
43.8	Localization meets superconductivity	849
	Additional Reading	850
	Problem	851

<b>44</b>	<b>Magnetic Impurities and their Interactions: The Anderson Model, the Kondo Effect, and the RKKY Interaction</b>	852
44.1	The Anderson Hamiltonian	853
44.2	The mean-field theory	854
44.2.1	Case $V_{\text{kd}} = 0, U \neq 0$	856
44.2.2	Case $V_{\text{kd}} \neq 0, U = 0$	856
44.2.3	Case $V_{\text{kd}} \neq 0, U \neq 0$	858
44.3	The s-d exchange model	863
44.4	The Kondo effect: electrical resistance versus temperature from paramagnetic impurities	866
44.5	Polarization of conduction electrons by an embedded spin; the RKKY interaction	868
44.5.1	Conduction electron polarization	868
44.5.2	The RKKY interaction	870
44.6	Spin glasses	871
	Additional Reading	872
	Problems	873
	Appendix 44A: Kondo's second-order perturbation theory calculation	873
	44A.1 Calculating the transition rate	874
	44A.2 Calculating the conductivity	878
<b>Part XIII Special Topics</b>		
<b>45</b>	<b>Strongly Correlated Systems</b>	883
45.1	The Mott insulator and the Mott transition	884
45.1.1	A simple model	885
45.1.2	A more realistic model	888
45.1.3	Incorporating the p states	890
45.2	The LDA implementation of DFT	891
45.2.1	An LDA + U implementation of DFT without orbital polarization	892
45.2.2	Generalized m-dependent Coulomb interactions; orbital polarization	895
45.3	Strongly correlated electrons in metals	896
45.3.1	A brief survey of some heavy fermion properties	897
45.3.2	Physical effects underlying heavy fermion behavior	901
45.4	Quantum phase transitions and marginal Fermi liquids	902
45.5	Possible mechanisms underlying heavy fermion superconductivity	904
	Supplementary Reading	904
<b>46</b>	<b>High Temperature Superconductors</b>	906
46.1	The discovery of cuprate superconductors	906
46.2	Some phenomenology of cuprate superconductors	909
46.3	Electronic structure of cuprates	911
46.4	Model Hamiltonians	913
46.5	Doping	914

46.6	Determining the Fermi surface of cuprates	915
46.7	Josephson coupled layered systems	917
46.7.1	The Lawrence–Doniach model	917
46.7.2	The upper critical fields	919
46.7.3	Finite layer thicknesses	920
46.7.4	An isolated vortex for the field parallel to the layers	921
46.7.5	An isolated vortex for the field perpendicular to a thin film: the pancake vortex	923
46.7.6	An isolated vortex for the field perpendicular to a stack of layers	925
46.8	Vortex matter and phase diagrams	925
46.9	Non-cuprate high temperature superconductors	927
46.10	Historical evolution of superconducting transition temperatures	927
	Supplementary Reading	929
<b>47</b>	<b>Artificially Structured and Patterned Materials; Surfaces and Interfaces</b>	<b>930</b>
47.1	Artificially layered materials	930
47.2	Artificial superlattices	930
47.3	Multilayer semiconductors	931
47.4	Quantum wells; modulation doping	932
47.5	Multiple wells and superlattices	934
47.6	Metallic multilayers	936
47.6.1	Superconducting multilayers	937
47.6.2	Magnetic multilayers	938
47.7	Spin tunneling	940
47.8	Spin torque oscillators	942
47.9	Surface states	943
47.10	Atoms at a free surface; reconstruction	946
47.11	Calculating surface and interface electronic properties	948
47.12	The chemical potential; the work function	950
47.13	Methods to measure the work function	952
47.13.1	The photoelectric effect	952
47.13.2	Thermionic emission	952
47.13.3	The Kelvin method	953
47.14	Electron affinity; work function of a semiconductor	955
	Additional Reading	956
	Problems	957
<b>48</b>	<b>The Quantum Hall Effects</b>	<b>958</b>
48.1	The integer quantum Hall effect	958
48.1.1	The phenomenon	958
48.1.2	An electron in two dimensions in a magnetic field: rectangular coordinates	959
48.1.3	A two-dimensional electron gas in a magnetic field	962
48.1.4	Motion under orthogonal electric and magnetic fields	963

48.1.5	Quantization of the Hall voltage: qualitative considerations	964
48.1.6	An electron in two dimensions in a magnetic field: cylindrical coordinates	965
48.1.7	Edge states	967
48.1.8	Localized states	968
48.2	The fractional quantum Hall effect	969
48.2.1	A semi-empirical accounting for observed filling fractions	969
48.2.2	Many-body ground states for non-interacting electrons in the lowest Landau level	971
48.2.3	Flux tubes	972
48.2.4	Adding flux tubes to the non-interacting many-body ground state wave function	974
48.2.5	Trial ground states for the fractional quantum Hall effect	975
48.2.6	The $\nu = 1/2$ state	977
	Additional Reading	977
	Problems	978
<b>49</b>	<b>Graphene, Carbon Nanotubes, and Fullerenes</b>	<b>979</b>
49.1	The electronic structure of graphene	979
49.2	Graphene multilayers	986
49.3	The band structure of graphene from ARPES	988
49.4	Graphene in a magnetic field	989
49.5	The Shubnikov-de Haas and quantum Hall effects in graphene	992
49.6	Single-walled nanotubes	993
49.7	Fullerenes	994
	Additional Reading	994
	Problems	995
	<b>Appendix A: The Calculus of Variations</b>	<b>997</b>
A.1	The Euler–Lagrange equations and the mechanics of particles	997
A.2	Extension of the Euler–Lagrange formalism to continuum fields	999
	<b>Appendix B: The Symmetry of Many-Particle Wave Functions; The Occupation Number Representation</b>	<b>1002</b>
B.1	The symmetry of two-particle wave functions	1002
B.2	The symmetry of many-particle wave functions	1005
B.3	Separation of spatial and spin coordinates in a many-particle system	1006
B.4	Interactions in many-particle systems	1006
B.5	Occupation number representation: Bose statistics	1008
B.6	Occupation number representation: Fermi statistics	1012
B.7	Time-dependent formalism	1015
B.8	Constructing many-particle state functions from vacuum state functions	1016
B.9	Performing calculations in the occupation number representation	1017
	Problems	1018
