### THE BASIC CONCEPTS

1. Introduction to Design Optimization	
1.1 The Design Process	4
1.2 Engineering Design Versus Engineering Analysis	6
1.3 Conventional Versus Optimum Design Process	6
1.4 Optimum Design Versus Optimal Control	8
1.5 Basic Terminology and Notation	8
1.5.1 Vectors and Points	8
1.5.2 Sets	9
1.5.3 Notation for Constraints	11
1.5.4 Superscripts/Subscripts and Summation Notation	11
1.5.5 Norm/Length of a Vector	12
1.5.6 Functions of Several Variables	13
1.5.7 Partial Derivatives of Functions	14
1.5.8 US–British Versus SI Units	15
Reference	18
2. Optimum Design Problem Formulation	
2.1 The Problem Formulation Process	20
2.1.1 Step 1: Project/Problem Description	20
2.1.2 Step 2: Data and Information Collection	21
2.1.3 Step 3: Definition of Design Variables	22
2.1.4 Step 4: Optimization Criterion	24
2.1.5 Step 5: Formulation of Constraints	25
2.2 Design of a Can	28
2.3 Insulated Spherical Tank Design	29
2.4 Sawmill Operation	32
2.5 Design of a Two-bar Bracket	33
2.6 Design of a Cabinet	40
2.6.1 Formulation 1 for Cabinet Design	41
2.6.2 Formulation 2 for Cabinet Design	41
2.6.3 Formulation 3 for Cabinet Design	42
2.7 Minimum-weight Tubular Column Design	43
2.7.1 Formulation 1 for Column Design	44
2.7.2 Formulation 2 for Column Design	45
2.8 Minimum-cost Cylindrical Tank Design	46
2.9 Design of Coil Springs	47
2.10 Minimum-weight Design of a Symmetric Three-bar Truss	50
2.11 A General Mathematical Model for Optimum Design	54
2.11.1 Standard Design Optimization Model	54
2.11.2 Maximization Problem Treatment	55
2.11.3 Treatment of “Greater Than Type” Constraints	56
2.11.4 Application to Different Engineering Fields	56
2.11.5 Important Observations about the Standard Model	56
2.11.6 Feasible Set	57
2.11.7 Active/Inactive/Violated Constraints	57
2.11.8 Discrete and Integer Design Variables	58
2.11.9 Types of Optimization Problems	59
2.12 Development of Problem Formulation for Practical Applications	60
Exercises for Chapter 2	61
References	70
3. Graphical Solution Method and Basic Optimization Concepts	
3.1 Graphical Solution Process	72
3.1.1 Profit Maximization Problem–Formulation	72

- 3.1.2 Step-by-step Graphical Solution Procedure 73
- 3.2 Use of *Mathematica* for Graphical Optimization 77
  - 3.2.1 Plotting Functions 78
  - 3.2.2 Identification and Shading of Infeasible Region for an Inequality 79
  - 3.2.3 Identification of Feasible Region 80
  - 3.2.4 Plotting of Objective Function Contours 80
  - 3.2.5 Identification of Optimum Solution 81
- 3.3 Use of MATLAB for Graphical Optimization 81
  - 3.3.1 Plotting of Function Contours 82
  - 3.3.2 Editing of Graph 85
- 3.4 Design Problem with Multiple Solutions 85
- 3.5 Design Problem with Unbounded Solutions 86
- 3.6 Infeasible Design Problem 87
- 3.7 Graphical Solution for the Minimum-weight Tubular Column 88
- 3.8 Graphical Solution for a Beam Design Problem 90
- Exercises for Chapter 3 92
- 4. Optimum Design Concepts: Optimality Conditions**
  - 4.1 Definitions of Global and Local Minima 106
    - 4.1.1 Minimum/Maximum 107
    - 4.1.2 Existence of a Minimum 112
  - 4.2 Review of Some Basic Calculus Concepts 113
    - 4.2.1 Gradient Vector: Partial Derivatives of a Function 114
    - 4.2.2 Hessian Matrix: Second-order Partial Derivatives 115
    - 4.2.3 Taylor's Expansion 117
    - 4.2.4 Quadratic Forms and Definite Matrices 120
  - 4.3 Concepts of Necessary and Sufficient Conditions 127
  - 4.4 Optimality Conditions: Unconstrained Problem 128
    - 4.4.1 Concepts Related to Optimality Conditions 128
    - 4.4.2 Optimality Conditions for Functions of a Single Variable 129
    - 4.4.3 Optimality Conditions for Functions of Several Variables 135
- 4.5 Necessary Conditions: Equality-constrained Problem 143
  - 4.5.1 Lagrange Multipliers 144
  - 4.5.2 Lagrange Multiplier Theorem 149
- 4.6 Necessary Conditions for a General Constrained Problem 152
  - 4.6.1 The Role of Inequalities 152
  - 4.6.2 Karush–Kuhn–Tucker Necessary Conditions 154
  - 4.6.3 Summary of the KKT Solution Approach 170
- 4.7 Postoptimality Analysis: the Physical Meaning of Lagrange Multipliers 171
  - 4.7.1 Effect of Changing Constraint Limits 171
  - 4.7.2 Effect of Cost Function Scaling on Lagrange Multipliers 175
  - 4.7.3 Effect of Scaling a Constraint on its Lagrange Multiplier 176
  - 4.7.4 Generalization of the Constraint Variation Sensitivity Result 177
- 4.8 Global Optimality 178
  - 4.8.1 Convex Sets 179
  - 4.8.2 Convex Functions 181
  - 4.8.3 Convex Programming Problem 183
  - 4.8.4 Transformation of a Constraint 187
  - 4.8.5 Sufficient Conditions for Convex Programming Problems 188
- 4.9 Engineering Design Examples 189
  - 4.9.1 Design of a Wall Bracket 189
  - 4.9.2 Design of a Rectangular Beam 193
- Exercises for Chapter 4 197
- 5. More on Optimum Design Concepts: Optimality Conditions**
  - 5.1 Alternate form of KKT Necessary Conditions 207
  - 5.2 Irregular Points 210
  - 5.3 Second-order Conditions for Constrained Optimization 212
  - 5.4 Second-order Conditions for the Rectangular Beam Design Problem 218
  - 5.5 Duality in Nonlinear Programming 220
    - 5.5.1 Local Duality: Equality Constraints Case 220
    - 5.5.2 Local Duality: The Inequality Constraints Case 226

Exercises for Chapter 5 229  
References 233

Exercises for Chapter 6 276  
References 278

## II

### NUMERICAL METHODS FOR CONTINUOUS VARIABLE OPTIMIZATION

6. Optimum Design: Numerical Solution Process and Excel Solver
- 6.1 Introduction to Numerical Search Methods 238
- 6.1.1 Derivative-based Methods 238
- 6.1.2 Direct Search Methods 239
- 6.1.3 Derivative-free Methods 240
- 6.1.4 Nature-inspired Search Methods 240
- 6.1.5 Selection of a Method 241
- 6.2 Optimum Design: Numerical Aspects of Problem Formulation 241
- 6.2.1 General Guidelines 241
- 6.2.2 Scaling of Constraints 242
- 6.2.3 Scaling of Design Variables 246
- 6.2.4 Iterative Process for Development of Problem Formulation 248
- 6.3 Numerical Solution Process for Optimum Design 250
- 6.3.1 Integration of an Application into General Purpose Software 250
- 6.3.2 How to Find Feasible Points 251
- 6.3.3 A Feasible Point Cannot Be Obtained 251
- 6.3.4 Algorithm Does Not Converge 252
- 6.4 Excel Solver: an Introduction 253
- 6.4.1 Excel Solver 253
- 6.4.2 Roots of a Nonlinear Equation 253
- 6.4.3 Roots of a Set of Nonlinear Equations 257
- 6.5 Excel Solver for Unconstrained Optimization Problems 260
- 6.6 Excel Solver for Linear Programming Problems 260
- 6.7 Excel Solver for Nonlinear Programming: Optimum Design of Springs 266
- 6.8 Optimum Design of Plate Girders using Excel Solver 268
7. Optimum Design with MATLAB®
- 7.1 Introduction to the Optimization Toolbox 279
- 7.1.1 Variables and Expressions 279
- 7.1.2 Scalar, Array, and Matrix Operations 280
- 7.1.3 Optimization Toolbox 280
- 7.2 Unconstrained Optimum Design Problems 282
- 7.3 Constrained Optimum Design Problems 285
- 7.4 Optimum Design Examples with MATLAB 288
- 7.4.1 Location of Maximum Shear Stress for Two Spherical Bodies in Contact 288
- 7.4.2 Column Design for Minimum Mass 290
- 7.4.3 Flywheel Design for Minimum Mass 293
- Exercises for Chapter 7 300  
References 304
8. Linear Programming Methods for Optimum Design
- 8.1 Linear Functions 308
- 8.2 Definition of a Standard LP Problem 308
- 8.2.1 Standard LP Definition 308
- 8.2.2 Transcription to Standard LP 310
- 8.3 Basic Concepts Related to LP Problems 313
- 8.3.1 Basic Concepts 314
- 8.3.2 LP Terminology 319
- 8.3.3 Optimum Solution to LP Problems 321
- 8.4 Calculation of Basic Solutions 323
- 8.4.1 The Tableau 323
- 8.4.2 The Pivot Step 324
- 8.4.3 Basic Solutions of  $\mathbf{Ax} = \mathbf{b}$  326
- 8.5 The Simplex Method 329
- 8.5.1 The Simplex 329
- 8.5.2 Basic Steps in the Simplex Method 330
- 8.5.3 Basic Theorems of LP 335
- 8.6 The Two-phase Simplex Method—Artificial Variables 343
- 8.6.1 Artificial Variables 343
- 8.6.2 Artificial Cost Function 345
- 8.6.3 Definition of the Phase I Problem 345

- 8.6.4 Phase I Algorithm 346
- 8.6.5 Phase II Algorithm 348
- 8.6.6 Degenerate Basic Feasible Solution 355
- 8.7 Postoptimality Analysis 356
  - 8.7.1 Changes in Constraint Limits 358
  - 8.7.2 Ranging Right-side Parameters 365
  - 8.7.3 Ranging Cost Coefficients 369
  - 8.7.4 Changes in the Coefficient Matrix 372
- Exercises for Chapter 8 374
- Reference 387
  
- 9. More on Linear Programming Methods for Optimum Design**
- 9.1 The Simplex Method: Derivation 389
  - 9.1.1 General Solution of  $\mathbf{Ax} = \mathbf{b}$  389
  - 9.1.2 Selection of a Nonbasic Variable that Should Become Basic 391
  - 9.1.3 Selection of a Basic Variable that Should Become Nonbasic 393
  - 9.1.4 Artificial Cost Function 394
  - 9.1.5 The Pivot Step 395
  - 9.1.6 The Simplex Algorithm 396
- 9.2 An Alternate Simplex method 397
- 9.3 Duality in Linear Programming 399
  - 9.3.1 Standard Primal LP Problem 399
  - 9.3.2 Dual LP Problem 399
  - 9.3.3 Treatment of Equality Constraints 401
  - 9.3.4 Alternate Treatment of Equality Constraints 402
  - 9.3.5 Determination of the Primal Solution from the Dual Solution 403
  - 9.3.6 Use of the Dual Tableau to Recover the Primal Solution 407
  - 9.3.7 Dual Variables as Lagrange Multipliers 410
- 9.4 Simplex Method and KKT Conditions for the LP Problem 411
  - 9.4.1 KKT Optimality Conditions 412
  - 9.4.2 Solution of the KKT Conditions 412
- 9.5 Quadratic Programming Problems 414
  - 9.5.1 Definition of a QP Problem 414
  - 9.5.2 KKT Necessary Conditions for the QP Problem 415
  - 9.5.3 Transformation of KKT Conditions 415
  - 9.5.4 The Simplex Method for Solving QP Problem 416
  
- Exercises for Chapter 9 420
- References 421
  
- 10. Numerical Methods for Unconstrained Optimum Design**
- 10.1 General Concepts 424
- 10.2 A General Iterative Algorithm 425
- 10.3 Descent Direction and Convergence of Algorithms 426
  - 10.3.1 Descent Direction and Descent Step 427
  - 10.3.2 Convergence of Algorithms 428
  - 10.3.3 Rate of Convergence 428
- 10.4 Step Size Determination: Basic Ideas 429
  - 10.4.1 Definition of the Step Size Determination Subproblem 429
  - 10.4.2 Analytical Method to Compute Step Size 431
- 10.5 Numerical Methods to Compute Step Size 432
  - 10.5.1 General Concepts 432
  - 10.5.2 Equal-interval Search 434
  - 10.5.3 Alternate Equal-interval Search 436
  - 10.5.4 Golden Section Search 437
- 10.6 Search Direction Determination: The Steepest-descent Method 442
- 10.7 Search Direction Determination: The Conjugate Gradient Method 445
- 10.8 Other Conjugate Gradient Methods 448
- Exercises for Chapter 10 449
- References 453
  
- 11. More on Numerical Methods for Unconstrained Optimum Design**
- 11.1 More on Step Size Determination 456
  - 11.1.1 Polynomial Interpolation 456
  - 11.1.2 Inexact Line Search: Armijo's Rule 460
  - 11.1.3 Inexact Line Search: Wolfe Conditions 462
  - 11.1.4 Inexact Line Search: Goldstein Test 462
- 11.2 More on the Steepest-descent Method 463
  - 11.2.1 Properties of the Gradient Vector 463
  - 11.2.2 Orthogonality of Steepest-descent Directions 468
- 11.3 Scaling of Design Variables 469

- 11.4 Search Direction Determination: Newton Method 472
    - 11.4.1 Classical Newton Method 472
    - 11.4.2 Modified Newton Method 473
    - 11.4.3 Marquardt Modification 478
  - 11.5 Search Direction Determination: Quasi-Newton Methods 479
    - 11.5.1 Inverse Hessian Updating: The DFP Method 479
    - 11.5.2 Direct Hessian Updating: The BFGS Method 482
  - 11.6 Engineering Applications of Unconstrained Methods 484
    - 11.6.1 Data Interpolation 485
    - 11.6.2 Minimization of Total Potential Energy 486
    - 11.6.3 Solution of Nonlinear Equations 488
  - 11.7 Solution of Constrained Problem Using Unconstrained Optimization Methods 489
    - 11.7.1 Sequential Unconstrained Minimization Techniques 490
    - 11.7.2 Augmented Lagrangian (Multiplier) Methods 492
  - 11.8 Rate of Convergence of Algorithms 494
    - 11.8.1 Definitions 494
    - 11.8.2 Steepest-descent Method 495
    - 11.8.3 Newton Method 496
    - 11.8.4 Conjugate Gradient Method 497
    - 11.8.5 Quasi-Newton Methods 497
  - 11.9 Direct Search Methods 498
    - 11.9.1 Univariate Search 498
    - 11.9.2 Hooke–Jeeves Method 499
    - 11.9.3 Nelder–Mead Simplex Method 500
  - Exercises for Chapter 11 506
  - References 508
- 12. Numerical Methods for Constrained Optimum Design**
- 12.1 Basic Concepts Related to Numerical Methods 512
    - 12.1.1 Basic Concepts Related to Algorithms for Constrained Problems 512
    - 12.1.2 Constraint Status at a Design Point 515
    - 12.1.3 The Descent Function 516
    - 12.1.4 Convergence of an Algorithm 516
  - 12.2 Linearization of the Constrained Problem 517
  - 12.3 The Sequential Linear Programming Algorithm 524
    - 12.3.1 Move Limits in SLP 524
    - 12.3.2 An SLP Algorithm 526
    - 12.3.3 The SLP Algorithm: Some Observations 530
  - 12.4 Sequential Quadratic Programming 531
  - 12.5 Search Direction Calculation: The QP Subproblem 532
    - 12.5.1 Definition of the QP Subproblem 532
    - 12.5.2 Solving the QP Subproblem 537
  - 12.6 The Step Size Calculation Subproblem 539
    - 12.6.1 The Descent Function 539
    - 12.6.2 Step Size Calculation: Line Search 542
  - 12.7 The Constrained Steepest-descent Method 547
    - 12.7.1 The CSD Algorithm 548
    - 12.7.2 The CSD Algorithm: Some Observations 548
  - Exercises for Chapter 12 549
  - References 553
- 13. More on Numerical Methods for Constrained Optimum Design**
- 13.1 Potential Constraint Strategy 556
  - 13.2 Inexact Step Size Calculation 560
    - 13.2.1 Basic Concept 560
    - 13.2.2 Descent Condition 560
    - 13.2.3 CSD Algorithm with Inexact Step Size 565
  - 13.3 Bound-constrained Optimization 572
    - 13.3.1 Optimality Conditions 573
    - 13.3.2 Projection Methods 574
    - 13.3.3 Step Size Calculation 576
  - 13.4 Sequential Quadratic Programming: SQP Methods 577
    - 13.4.1 Derivation of the Quadratic Programming Subproblem 578
    - 13.4.2 Quasi-Newton Hessian Approximation 580
    - 13.4.3 SQP Algorithm 582
    - 13.4.4 Observations on SQP Methods 587
    - 13.4.5 Descent Functions 587
  - 13.5 Other Numerical Optimization Methods 588
    - 13.5.1 Method of Feasible Directions 588
    - 13.5.2 Gradient Projection Method 591
    - 13.5.3 Generalized Reduced Gradient Method 592

- 13.6 Solution of the Quadratic Programming Subproblem 593
- 13.6.1 KKT Necessary Conditions for QP 594
- 13.6.2 Direct Solution of the QP Subproblem 596
- Exercises for Chapter 13 597
- References 598
- 14. Practical Applications of Optimization**
- 14.1 Formulation of Practical Design Optimization Problems 602
- 14.1.1 General Guidelines 602
- 14.1.2 Example of a Practical Design Optimization Problem 603
- 14.2 Gradient Evaluation of Implicit Functions 609
- 14.3 Issues in Practical Design Optimization 614
- 14.3.1 Selection of an Algorithm 614
- 14.3.2 Attributes of a Good Optimization Algorithm 614
- 14.4 Use of General-purpose Software 615
- 14.4.1 Software Selection 616
- 14.4.2 Integration of an Application into General-purpose Software 616
- 14.5 Optimum Design: Two-member Frame with Out-of-plane Loads 617
- 14.6 Optimum Design: Three-bar Structure for Multiple Performance Requirements 619
- 14.6.1 Symmetric Three-bar Structure 619
- 14.6.2 Asymmetric Three-bar Structure 621
- 14.6.3 Comparison of Solutions 625
- 14.7 Optimal Control of Systems by Nonlinear Programming 625
- 14.7.1 A Prototype Optimal Control Problem 625
- 14.7.2 Minimization of Error in the State Variable 629
- 14.7.3 Minimum Control Effort Problem 635
- 14.7.4 Minimum Time Control Problem 637
- 14.7.5 Comparison of Three Formulations for the Optimal Control of System Motion 639
- 14.8 Optimum Design of Tension Members 639
- 14.9 Optimum Design of Compression Members 644
- 14.9.1 Formulation of the Problem 644
- 14.9.2 Formulation of the Problem for Inelastic Buckling 649
- 14.9.3 Formulation of the Problem for Elastic Buckling 651
- 14.10 Optimum Design of Members for Flexure 652
- 14.11 Optimum Design of Telecommunication Poles 664
- 14.12 Alternative Formulations for Structural Optimization Problems 672
- 14.13 Alternative Formulations for Time-dependent Problems 674
- Exercises for Chapter 14 675
- References 679

### III

## ADVANCED AND MODERN TOPICS ON OPTIMUM DESIGN

- 15. Discrete Variable Optimum Design Concepts and Methods**
- 15.1 Basic Concepts and Definitions 684
- 15.1.1 Definition of a Mixed Variable Optimum Design Problem: MV-OPT 684
- 15.1.2 Classification of Mixed Variable Optimum Design Problems 685
- 15.1.3 Overview of Solution Concepts 686
- 15.2 Branch-and-bound Methods 687
- 15.2.1 Basic BBM 687
- 15.2.2 BBM with Local Minimization 689
- 15.2.3 BBM for General MV-OPT 691
- 15.3 Integer Programming 692
- 15.4 Sequential Linearization Methods 693
- 15.5 Simulated Annealing 693
- 15.6 Dynamic Rounding-off Method 696
- 15.7 Neighborhood Search Method 697
- 15.8 Methods for Linked Discrete Variables 697
- 15.9 Selection of a Method 699
- 15.10 Adaptive Numerical Method for Discrete Variable Optimization 699

- 15.10.1 Continuous Variable Optimization 701
- 15.10.2 Discrete Variable Optimization 701
- Exercises for Chapter 15 702
- References 705

## 16. Global Optimization Concepts and Methods

- 16.1 Basic Concepts of Solution Methods 708
  - 16.1.1 Basic Solution Concepts 708
  - 16.1.2 Overview of Methods 709
- 16.2 Overview of Deterministic Methods 710
  - 16.2.1 Covering Methods 711
  - 16.2.2 Zooming Method 712
  - 16.2.3 Methods of Generalized Descent 712
  - 16.2.4 Tunneling Method 714
- 16.3 Overview of Stochastic Methods 716
  - 16.3.1 Pure Random Search Method 717
  - 16.3.2 Multistart Method 717
  - 16.3.3 Clustering Methods 718
  - 16.3.4 Controlled Random Search 720
  - 16.3.5 Acceptance–Rejection Methods 721
  - 16.3.6 Stochastic Integration 722
- 16.4 Two Local-global Stochastic Methods 723
  - 16.4.1 Conceptual Local-global Algorithm 723
  - 16.4.2 Domain Elimination Method 724
  - 16.4.3 Stochastic Zooming Method 726
  - 16.4.4 Operations Analysis of Methods 727
- 16.5 Numerical Performance of Methods 729
  - 16.5.1 Summary of Features of Methods 730
  - 16.5.2 Performance of Some Methods with Unconstrained Problems 731
  - 16.5.3 Performance of Stochastic Zooming and Domain Elimination Methods 731
  - 16.5.4 Global Optimization of Structural Design Problems 732
- Exercises for Chapter 16 734
- References 737

## 17. Nature-inspired Search Methods

- 17.1 Genetic Algorithms (GA) for Optimum Design 741
  - 17.1.1 Basic Concepts and Definitions Related to GA 741

- 17.1.2 Fundamentals of Genetic Algorithms 743
- 17.1.3 Genetic Algorithm for Sequencing-type Problems 748
- 17.1.4 Applications of GA 749
- 17.2 Differential Evolution Algorithm 750
  - 17.2.1 Generation of Initial Population for DEA 750
  - 17.2.2 Generation of a Donor Design for DEA 751
  - 17.2.3 Crossover Operation to Generate the Trial Design in DEA 752
  - 17.2.4 Acceptance/Rejection of the Trial Design in DEA 752
  - 17.2.5 Differential Evolution Algorithm 752
- 17.3 Ant Colony Optimization 755
  - 17.3.1 Ant Behavior 755
  - 17.3.2 ACO Algorithm for the Traveling Salesman Problem 757
  - 17.3.3 ACO Algorithm for Design Optimization 760
- 17.4 Particle Swarm Optimization 764
  - 17.4.1 Swarm Behavior and Terminology 764
  - 17.4.2 Particle Swarm Optimization Algorithm 765
- Exercises for Chapter 17 766
- References 769

## 18. Multi-objective Optimum Design Concepts and Methods

- 18.1 Problem Definition 771
- 18.2 Terminology and Basic Concepts 773
  - 18.2.1 Criterion Space and Design Space 773
  - 18.2.2 Solution Concepts 776
  - 18.2.3 Preferences and Utility Functions 779
  - 18.2.4 Vector Methods and Scalarization Methods 780
  - 18.2.5 Generation of Pareto Optimal Set 780
  - 18.2.6 Normalization of Objective Functions 780
  - 18.2.7 Optimization Engine 781
- 18.3 Multi-objective Genetic Algorithms 781
- 18.4 Weighted Sum Method 785
- 18.5 Weighted Min–max Method 785

- 18.6 Weighted Global Criterion Method 786  
 18.7 Lexicographic Method 788  
 18.8 Bounded Objective Function Method 788  
 18.9 Goal Programming 789  
 18.10 Selection of Methods 790  
 Exercises for Chapter 18 790  
 References 793
19. Additional Topics on Optimum Design
- 19.1 Meta-models for Design Optimization 795  
 19.1.1 Meta-model 795  
 19.1.2 Response Surface Method 797  
 19.1.3 Normalization of Variables 801  
 19.2 Design of Experiments for Response Surface Generation 805  
 19.3 Discrete Design with Orthogonal Arrays 813  
 19.4 Robust Design Approach 817  
 19.4.1 Robust Optimization 818  
 19.4.2 The Taguchi Method 825  
 19.5 Reliability-based Design Optimization—Design Under Uncertainty 833  
 19.5.1 Review of Background Material for RBDO 833  
 19.5.2 Calculation of the Reliability Index 838  
 19.5.3 Formulation of Reliability-based Design Optimization 848  
 References 849
- Appendix A. Vector and Matrix Algebra
- A.1 Definition of Matrices 851  
 A.2 Types of Matrices and their Operations 853  
 A.2.1 Null Matrix 853  
 A.2.2 Vector 853  
 A.2.3 Addition of Matrices 853  
 A.2.4 Multiplication of Matrices 853  
 A.2.5 Transpose of a Matrix 855  
 A.2.6 Elementary Row-column Operations 856  
 A.2.7 Equivalence of Matrices 856  
 A.2.8 Scalar Product—Dot Product of Vectors 856  
 A.2.9 Square Matrices 857  
 A.2.10 Partitioning of Matrices 857  
 A.3 Solving  $n$  Linear Equations in  $n$  Unknowns 858  
 A.3.1 Linear Systems 858  
 A.3.2 Determinants 859  
 A.3.3 Gaussian Elimination Procedure 862  
 A.3.4 Inverse of a Matrix: Gauss-Jordan Elimination 866  
 A.4 Solution to  $m$  Linear Equations in  $n$  Unknowns 869  
 A.4.1 Rank of a Matrix 869  
 A.4.2 General Solution of  $m \times n$  Linear Equations 870  
 A.5 Concepts Related to a Set of Vectors 876  
 A.5.1 Linear Independence of a Set of Vectors 876  
 A.5.2 Vector Spaces 880  
 A.6 Eigenvalues and Eigenvectors 882  
 A.7 Norm and Condition Number of a Matrix 884  
 A.7.1 Norm of Vectors and Matrices 884  
 A.7.2 Condition Number of a Matrix 885  
 A.8 Exercises for Appendix A 885
