

THIRD EDITION

ECOLOGY AND MANAGEMENT OF  
**FOREST SOILS**

RICHARD F. FISHER and DAN BINKLEY

## CONTENTS

---

<b>Preface</b>	<b>xi</b>
<b>1. Introduction</b>	<b>1</b>
Forest Soils Differ in Many Ways from Cultivated Soils	4
Forest Soil Science Is as Old as Soil Science Itself	7
Summary	10
<b>2. Forest Soils and Vegetation Development</b>	<b>11</b>
Pedogenic Processes Operate Simultaneously at Varying Rates	11
External Factors Guide Soil Formation	14
Parent Material	15
Nonsilicates	15
Silicates	17
Parent Material Classification	25
Climate and Weathering	25
Biological Weathering	28
Topography, Time, and Biota	29
Vegetation and Soil Develop Together But at Quite Different Rates	30
Soil Properties Influence Vegetation Development	34
Summary	35
<b>3. Soils of the Major Forest Biomes</b>	<b>37</b>
Soils Commonly Differ as Much Within Regions as Around the Globe	37
Soil Types Are Distributed Unevenly Around the Globe	41
Major Forest Types Occur on a Variety of Soils	42
Tropical Forests Are Diverse and Occur on a Diverse Range of Soils	42
Tropical Climates Are Warm Year Round, and Precipitation Varies Among Regions	44
Rain Forests Have no Prolonged Dry Season	46
Monsoon Forests Have Seasonal Periods of Drought and Rain	48
	<b>vii</b>

Many Tropical Forests Are Dry	49
Tropical Montane Forests Have Moderate, Uniform Climates	50
Plantation Forestry Is Extensive Throughout the Tropics	50
Some Temperate Broad-Leaved Forests Are Evergreen	53
Temperate Rain Forests Are Among the Largest in the World	53
Lowland Coniferous Forests Are Major Sources of Timber	55
Temperate Zone Mixed Forests Include Conifers and Hardwoods	55
Temperate Montane Conifer Forests	57
Boreal Forests Cover Vast Areas	58
Summary	60
<b>4. Physical Properties of Forest Soils</b>	<b>61</b>
Soil Texture Is Fundamental	61
Texture Influences Tree Growth	63
Soil Structure Moderates Effects of Soil Texture	64
Bulk Density Accounts for the Composition of Minerals, Organics, and Pore Space	65
Life in the Soil Depends on the Soil Atmosphere	67
Soil Structure Can Be Harmed by Inappropriate Management Activities	69
Soil Color Incorporates Effects of Organic Matter and Other Factors	70
Soil Temperature Influences Biotic and Abiotic Process Rates	71
Soil Water Is Part of the Hydrological Cycle	75
Water Flow in Unsaturated Soils Depends on Water Content and Hydraulic Conductivity	77
Factors Affecting Infiltration and Losses of Water	78
Trees May Get Water from the Capillary Fringe	81
Trees Require Great Quantities of Water	82
Physics in a Landscape Context Can Determine Soil Chemistry	83
Summary	85
<b>5. Soil Chemistry and Nutrient Uptake</b>	<b>87</b>
Major Soil Anions Include Chloride, Sulfate, Bicarbonate, and Sometimes Nitrate	87
Major Soil Cations Include Sodium, Potassium, Calcium, Magnesium, and Sometimes Aluminum	88
Soil Solutions Also Contain Silicic Acid, Dissolved Organic Chemicals, and Gases	91
Solution Chemistry Is Regulated by Inputs, Outputs, and Reversible Reactions	92
The Solid Phase of the Soil Has Four Major Components	92
Cations Exchange Is a Reversible, Electrostatic Sorption	95

Cation Valence and Hydrated Radius Explain the Selectivity of the Exchange Complex	96
The Ratio of Aluminum to Base Cations May (or May Not) Be Important	97
Soil Acidity Involves Acid-Base Reactions Between Solid and Solution Phases	98
The pH of Soil Solutions Is Buffered by the Solid Phases	99
Factor 1: Increases in Salt Concentration Decrease pH	100
Factor 2: Soil pH Decreases as Total Soil Acidity Increases	101
Factor 3: The Distributions of Cations Is Often Called Base Saturation	102
Factor 4: The Strength of Soil Acids Also Influences pH	103
Comparisons of Titration Curves Can Explain Why pH Differs Among Soils	104
Soil pH Increases from Upper-Slope to Lower-Slope Sites	105
Phosphate and Sulfate Concentrations Depend on Specific Adsorption	106
Nutrient Supply and Uptake	108
Nutrient Uptake Depends on Soil Chemistry and the Absorbing Surface Area of Trees	111
Nutrient Uptake Also Depends on Uptake Kinetics	112
Soil Solutions Are Sampled in Several Ways, and No Way Is Perfect	114
Soil Solutions and Plant Uptake Are Linked to Ecosystem Biogeochemistry	115
Summary	115
<b>6. Biology of Forest Soils</b>	<b>118</b>
Soil Organisms Perform a Wide Variety of Functions	119
Soil Fauna Play a Role in Natural Soil Ecosystems	120
Macrofauna Are Movers and Shakers	120
Vertebrates	120
Arthropods	121
Annelids	122
Mesofauna Fragment Debris and Promote Soil Structure	123
Microfauna Thrive in Soil Water Films	123
Nematodes	123
Rotifers	124
Protozoa	124
Soil Microflora Are Small in Size, Great in Importance	124
Bacteria	125
Actinomycetes	129
Fungi	130
Algae	131

Higher Plant Rhizospheres Are Hotbeds of Microbial Activity	133
Soil Conditions Strongly Influence Soil Organism Activity	135
Soil Organisms May Be Valuable Indicators of Soil Health	136
Summary	137
<b>7. Soil Organic Matter</b>	<b>139</b>
Organic Matter Fuels the Soil's Engine	139
Forest Floors Have a Distinctive Structure	141
Humus Layers Come in a Variety of Types	141
Several Forest Floor Classifications Are Used in North America	142
Forest Floor Decomposition Varies Among Humus Types	144
Many Factors Control Forest Floor Accumulation	146
Physical Properties of Forest Floors	148
Chemical Properties of Forest Floors	149
Natural and Managed Processes Alter the Forest Floor	151
Organic Carbon Is a Vital Constituent of the Soil	155
Soil Organic Carbon Occurs in a Wide Variety of Forms	156
Soil Organic Matter Performs Many Functions	158
Summary	160
<b>8. Soils and Roots</b>	<b>161</b>
Root Systems Have a Characteristic Form and an Enormous Extent	161
Form May Be Obligatory or Facultative	162
Roots Grow and Grow	164
Soil Conditions Alter Root Growth	166
Physical Impedance	166
Soil Moisture	167
Soil Temperature	169
Soil Chemistry	171
Roots Contribute Significantly to Soil Properties	172
Mycorrhizae—Unique Root Forms with an Important Function	173
There Are Two Types of Mycorrhizae	174
Ectomycorrhizae	174
Endomycorrhizae	176
Soils Factors Affect Mycorrhizal Development	178
Mycorrhizae Benefit the Host	180
Summary	182
<b>9. Forest Biogeochemistry</b>	<b>184</b>
Energy Flows with Electrons	184

Nutrient Cycles Involve Pools and Fluxes	187
Annual Nutrient Cycling Is Greater Than Annual Inputs	189
Litter Decays Like Radioactive Material But for Different Reasons	190
Forest Floors Accumulate and May Or May Not Reach Steady States	194
How Does Litter Become Soil Humus?	197
Litterfall and Root Death Are Major Pathways of Nutrient Return	197
Trees Adjust to Nutrient Limitations	199
Nutrient Transport and Mobility within Plants Are Also Important	200
Internal Recycling Increases as Nutrient Availability Increases	201
Nutrient Inputs Have Three Major Vectors	202
Cycles Differ Substantially Among Nutrients	207
Carbon Flows Through Forests	210
Oxygen Fuels Energy Reactions	212
Hydrogen Ion Budgets Integrate Biogeochemical Cycles	213
The Nitrogen Cycle Dominates Forest Nutrition	218
Phosphorus Cycling Is Controlled by Both Biotic and Geochemical Processes	224
Potassium Is the Most Mobile Soil Nutrient	230
Calcium and Magnesium Have Similar Biogeochemistries	231
Sulfur Cycling Is More Complicated Than Nitrogen Cycling	232
Small Quantities of Micronutrients Play Large Roles	234
Nutrient Use and Nutrient Supply Change as Stands Develop	235
Three Rules of Biogeochemistry	237
Summary	239
<b>10. Fire Effects</b>	<b>241</b>
Most Forests Burn	241
Fire Physics Largely Determine Fire Impacts on Forest Soils	243
Fires Remove Nutrients by Fire Processes	245
Nitrogen Losses Are Primarily from Oxidation, Not Volatilization	245
Nutrient Leaching Rates Increase After Fire	250
Erosion May Increase Nutrient Losses After Fire	250
Fires May Decrease Water Infiltration Into Soils	252
Ash May Contain Large Quantities of Nutrients	253
Direct Nutrient Release from Soil Heating May Be Important	253
Decomposition and Microbial Activity Change After Fire	253
Soil Acidity Declines and pH Rises after Fire	254
Base Cations May Increase After Fire	256

Phosphorus Availability Increases After Fire, at Least Temporarily	257
Nitrogen Availability Also Increases After Fire	258
Nitrogen Fixation Increases After Fire Only If Symbiotic Nitrogen-Fixing Species Increase	258
Long-Term Effects of Fire on Soil Productivity Remain Uncertain	259
Summary	260
<b>11. Forest Soil Classification</b>	<b>262</b>
Site Index Is a Troubling But Preferred Way to Measure Site Quality	263
Soil Classification and Survey Are Essential to Sound Forest Management	265
The USDA National Cooperative Soil Survey	266
Forest Soil Surveys Are Common on Industrial Forestland	267
Multifactor Classification Schemes Have Gained Popularity	269
Soil Factors Dramatically Influence Forest Development and Tree Growth	270
Interpretations to Aid in Forest Management Can Be Developed for Soil Map Units	276
Summary	280
<b>12. Nutrition Management: Nutrient Limitations</b>	<b>282</b>
Nitrogen and Phosphorus Are the Most Common Limiting Nutrients	282
Basic Approaches to Diagnosing Nutrient Limitation	284
Establishment of Field Trials Is the First Step	286
Relating Response to Site Variables Is the Second Step	288
Foliar Nutrients May Identify Nutrient Limitations	289
Visible Symptoms Can Indicate Severe Problems	291
Nutrient Concentrations Can Identify Major Deficiencies	292
Vector Analysis May Help Identify Limiting Nutrients	294
DRIS Combines Foliar Concentrations, Nutrient Ratios, and Growth	296
Soil Assays	297
Which Soil Pool Is the Best Indicator of Site Fertility and Nutrient Limitation?	297
How Available Is Soil Nitrogen?	298
Ion Exchange Resin Bags Are Sensitive to a Range of Factors	303
Various Indexes Have Proven Useful for Different Regions	304

Soil Phosphorus Availability Is Usually Estimated by Extractions	305
Soil Sulfur Assays Are Similar to Phosphorus Assays	307
Cation Availability Is Also Difficult to Assess	307
Soil Micronutrient Assays Are Performed Rarely	308
The Final Step in Nutrition Assessment Is Operational Assessment of Sites	308
Interaction Between Nutrition and Pests and Pathogens	308
Thinning Increases the Nutrient Supply per Tree	310
Summary	310
<b>13. Nutrition Management: Fertilization</b>	<b>311</b>
Fertilization Commonly Increases Net Primary Production and Reduces Allocation to Roots, Increasing Wood Growth	313
Fertilization Changes Stand Characteristics	314
Nutrient Limitation Is Common Across All Stands Ages	316
Application Methods Include Airplanes, Helicopters, and Tractors	316
Formulation Is Important	317
Nitrogen Fertilizers Are Synthesized from Nitrogen Gas and Natural Gas	318
Phosphate Fertilizers Are Mined	320
Sulfur Fertilizers Are Used Mainly to Lower soil pH	321
Fertilization with "Lime" Material Can Alleviate Calcium and Magnesium Deficiencies	321
Raising Soil pH Requires Large Amounts of Lime	322
Only About 10 to 20 Percent of the Fertilizer Enters the Trees	324
Where Did the Missing Fertilizer Go?	325
Why Doesn't More Fertilizer Get Into the Trees?	326
Fertilization Increases Growth for Periods Ranging from 5 Years to Entire Rotations	327
Fertilizer Responses May Differ Among Species and Genotypes	327
Site Preparation May Increase the Fertilization Response	328
Fertilization May Affect Nontarget Vegetation	329
Fertilization Usually Has Minor Effects on Water Quality	330
Waste Disposal on Forestlands May Increase Stand Productivity	332
Wastewater Is a Rich Nutrient Solution	333
Sewage Sludge Resembles Soil Humus	333
Heavy Metal Concentrations in Sludge Are a Serious Concern	335
Nutrition Assessment Provides Information for Decision Making	335
Forest Nutrition Management Involves Unavoidable Uncertainty	336
Inflation and Changes in Stumpage Values May Alter Profitability	337

Compound Interest Favors Late-Rotation Fertilization	338
Growth Responses Are Uncertain	338
Breakeven Analysis Is the Simplest Approach	339
A Decision Tree Identifies Choices, Probabilities, and Outcomes	340
Fertilization Entails two Kinds of Risk	341
What Is the Value of Perfect Information?	343
What Is the Value of Imperfect Information?	345
The Value of Research Depends on Existing Knowledge and Forest Size	346
Fertilization Is an Investment of Energy as Well as Money	346
Summary	347
<b>14. Nutrition Management: Biological Nitrogen Fixation</b>	<b>348</b>
Nitrogen Fixation Was Harnessed in Forestry Shortly After Its Discovery	348
Nitrogenase Enzyme Reduces Nitrogen Gas to Ammonia	350
Three Types of Nitrogen Fixers May Be Important in Forest Soils	350
Symbiotic Nitrogen Fixation Can Be Used in Nutrition Management Program	351
Nitrogen Fixation Rates Are Difficult to Measure	354
<sup>15</sup> N Labeling Shows High Rates of Nitrogen Fixation for <i>Leucaena</i> and <i>Casuarina</i>	355
Natural Abundance of <sup>15</sup> N Is Affected by Nitrogen Fixation in Forests	355
Nitrogen Accretion and Chronosequences Can Catch Large Rates of Nitrogen Fixation	356
Acetylene Reduction Assays Estimate Current Rates of Nitrogen Fixation	359
Favorable Environments Allow High Rates of Nitrogen Fixation	361
Does Nitrogen Fixation Decline as Soil Nitrogen Increases?	362
Nitrogen Fixation Accelerates Nitrogen Cycling	363
Nitrogen-Fixing Plants Also Affect Cycles of Other Nutrients	363
Nitrogen-Fixing Trees Acidify Soil in Some Ecosystems But Not in Others	364
Soil Carbon Increases Under Nitrogen-Fixing Species	366
Many Silvicultural Strategies Can Employ Nitrogen-Fixing Species	366
Nitrogen Fixers Can Take Advantage of Unused Site Resources	367
When Does Fixed Nitrogen Begin to Benefit Associated Crop Trees?	368
The Growth Response to Nitrogen Fixation May Have Three Components	369
The Crop Tree Response to Nitrogen Varies with Site Fertility	370

How Much Nitrogen Fixation Is Needed to Supply Crop Trees?	371
Is a Kilogram of Fixed Nitrogen Equal to a Kilogram of Fertilizer Nitrogen?	372
Nitrogen-Fixing Plants Can Alter the Impact of Animals and Diseases	373
Nitrogen Fixation May Have Multiple Resource Benefits	373
Why Isn't Nitrogen Fixation Used More Often in Forestry?	374
Is Nitrogen Fixation Profitable?	374
Summary	375
<b>15. Forest Soil Management</b>	<b>376</b>
Soil Management Plays a Major Role in Intensive Plantation Forestry	376
Land Clearing May Adversely Impact Soil Productivity	377
Soil Preparation for Stand Establishment	380
Scarification Is a Means of Exposing Mineral Soil	380
Cultivation Often Increases Survival and Early Growth of Planted Seedlings	380
Soil Management on Extreme Sites	383
Dry, Sandy Soils Pose Special Problems to Forest Managers	385
Irrigation or Fertigation on Dry Sites Is Becoming Popular	387
Seasonally Flooded Soils Present Unique Problems	387
Peatlands Are Often Managed for Forest Production	389
Gelisals Present Major Problems	391
Turning Mine Spoil Back into Soil is a Challenge	391
Management of Nursery Soils	394
Nursery Site Selection Is Important to Successful Production	395
Soil Texture Is Often the Key to Success or Failure	396
Site Leveling May Be Necessary But Is Problematic	396
Soil Fertility and Acidity Management Are Crucial to Nursery Success	397
Soil Organic Matter Is Generally the Key to a Productive Nursery	398
Cover Crops Serve Several Purposes	399
Other Organic Additions Are Generally Necessary	400
A Fertilization Program Is Essential to Excellent Nursery Stock Production	401
Soil Testing Is a Must	402
Fertilization Is a Two-Step Process	403
Tree Conditioning for Transplanting Improves Survival and Growth	404
Biocides Protect Seedlings But Alter Nursery Soil Processes	405
Summary	406

<b>16. Long-Term Soil Productivity</b>	<b>408</b>
There Are Three Major Ways to Be Wrong	409
How Rapidly Do Forest Soils Change in the Absence of Management?	409
How Do Forest Soils Change Under the Influence of Different Species?	411
How Does Reforestation Improve Former Agricultural Soils?	415
How Does Harvesting Affect Soil Fertility?	420
Will Acid Deposition Degrade Forest Soils?	425
If the Climate Warms, Will Forest Soils Change?	433
Summary	434
<b>References</b>	<b>435</b>
