

Liquid Composite Molding

Richard S. Parnas

HANSER

Contents

1 Introduction	9
1.1 Composite Materials	9
1.2 How Composites are Made	15
1.3 Summary	20
References	22
2 Fundamentals – Transport Phenomena	23
2.1 Flow Through Porous Media – Single Phase Flow	23
2.1.1 Darcy's Law and the Permeability Tensor	23
2.1.2 Measuring the Effective Permeability	25
2.1.3 Analyzing the Experiments for the Permeability Tensor	30
2.1.4 2-Dimensional vs. 3-Dimensional Data Analysis	36
2.2 Heat Transfer and Chemical Reaction in Porous Media	38
2.2.1 Volume Averaging	38
2.2.2 The Energy Balance	40
2.2.3 RTM	41
2.2.4 SRIM and the Species Equation	44
2.3 Rheokinetics	45
2.3.1 Resin Reaction Kinetics	47
2.3.2 The Effects of Cure on the Viscosity	55
References	56
Homework Problems	58
Appendix I	59
Appendix II	60
Appendix III	63
3 RTM Fundamentals – Reinforcement Construction	65
3.1 Reinforcement Materials	65
3.2 Getting Ready for Preforming	69
3.3 2-Dimensional Fabrics and Early Preforming Methods	72
3.3.1 Random Mats	72
3.3.2 Textile Fabrics	75
3.4 Preforming 3-Dimensional Shapes	84
References	85
Homework Problems	86

4 Manufacturing Composites	87
4.1 Design and Optimization	87
4.1.1 Physical Model Based Design and Optimization	88
4.1.2 Neural Network and Genetic Algorithm Based Design and Optimization ..	115
4.2 Tooling	123
4.3 Measurement and Control	130
4.3.1 Process Measurements	130
4.3.2 Process Control	140
References	145
Homework Problems	146
5 The Microstructure	149
5.1 Multi-Phase Flows	149
5.1.1 A Simple Model of Void Formation in LCM	151
5.1.2 Innovative Processing Technology for LCM	157
5.2 Optical Coherence Tomography	159
5.2.1 Instrumentation for Optical Coherence Tomography	159
5.2.2 OCT as a Tool to Help Predict Permeability	160
5.2.3 OCT for Non-Destructive Evaluation	163
References	165
Homework Problems	165
Subject Index	167
6 The CD	
6.1 Color Figures	
6.2 MPEG-files of Model Filling	
6.3 Crimson Flow Simulation Package	
6.4 Permeability Database
