# Manual on the use of Rock in Hydraulic Engineering

Ministry of Transport, Public Works and Water Management

**Road and Hydraulic Engineering Division**

Directorate-General for Public Works and Water Management

# Content of manual on rock in hydraulic engineering

Preface

Acknowledgements

Glossary

Notation

## Chapter 1 Introduction

- 1.1 Use of Rock
- 1.2 Background and approach
- 1.3 Use of the Manual
  - 1.3.1 Design process
  - 1.3.2 Structure and contents of the Manual
- 1.4 Structure types covered by the Manual

## Chapter 2 Planning and Design

- 2.1 Design process
  - 2.1.1 Problem identification
  - 2.1.2 Boundary conditions
    - 2.1.2.1 Planning policy, policy analysis
    - 2.1.2.2 Acceptable risk
  - 2.1.3 Functional Analysis
  - 2.1.4 Generation of alternative solutions
    - 2.1.4.1 Environmental Assessment
    - 2.1.4.2 Materials availability and properties
    - 2.1.4.3 Understanding the hydraulic and geotechnical processes
    - 2.1.4.4 Structure-specific design methods
    - 2.1.4.5 Construction considerations
    - 2.1.4.6 Management and Maintenance considerations
  - 2.1.5 Comparison and selection
  - 2.1.6 Final design and detailing
  - 2.1.7 Cost Assessment
  - 2.1.8 Quality Assurance
    - 2.1.8.1 Quality Control
- 2.2 Structure types and failure modes
  - 2.2.1 Structure types
  - 2.2.2 Principal failure modes
  - 2.2.3 Fault tree analysis
    - 2.2.3.1 Definition of damage
    - 2.2.3.2 Fault tree systems and mechanisms

- 2.2.4 Risk analysis
- 2.3 Design approach
  - 2.3.1 Deterministic approach
  - 2.3.2 Probabilistic approach
    - 2.3.2.1 Level III methods
    - 2.3.2.2 Level II methods
    - 2.3.2.3 Examples of probabilistic calculations
- 2.4 Environmental Assessment
  - 2.4.1 Reasons for carrying out E.A.
  - 2.4.2 E.A. as an integral part of the design process
  - 2.4.3 Method of assessment
  - 2.4.4 Additional sources of information
  - 2.4.5 Assessing the impacts of the Proposed Works
    - 2.4.5.1 Geomorphology, landscape and existing physical processes
    - 2.4.5.2 Ecology
    - 2.4.5.3 Social and socio-economic aspects
    - 2.4.5.4 Human sensory aspects
    - 2.4.5.5 Palaeontological, archaeological, historical and cultural aspects
    - 2.4.5.6 Air, water and soil quality
  - 2.4.6 Impacts from the choice of materials and construction
    - 2.4.6.1 Sources of material
    - 2.4.6.2 Use of waste materials in shoreline works
    - 2.4.6.3 Construction
  - 2.4.7 The Environmental Statement (ES)

## **Chapter 3 Material**

- 3.1 Introduction
- 3.2 Rock Types
  - 3.2.1 Evaluation of rock types at Source
  - 3.2.2 Alluvial, glacial and marine sources of rock materials
- 3.3 Properties and functions
  - 3.3.1 Intrinsic properties
    - 3.3.1.1 Colour
    - 3.3.1.2 Density
    - 3.3.1.3 Water absorption and rock porosity
    - 3.3.1.4 Discontinuities
    - 3.3.1.5 Weathering grade
    - 3.3.1.6 Intact fabric strength
  - 3.3.2 Production affected properties
    - 3.3.2.1 Block integrity
    - 3.3.2.2 Block shape
    - 3.3.2.3 Grading
    - 3.3.2.4 Block mass and size
  - 3.3.3 Construction-induced properties
    - 3.3.3.1 Interlocking and porosity
    - 3.3.3.2 Internal friction
    - 3.3.3.3 Roughness of layer topography

- 3.3.3.4 Implications for porosity, density and layer thickness
- 3.3.4 Durability and armour stone degradation rates
- 3.4 Testing and evaluation
  - 3.4.1 Introduction
  - 3.4.2 Test methods
- 3.5 Production and handling
  - 3.5.1 Resource appraisal
    - 3.5.1.1 Terrestrial Sources
    - 3.5.1.2 Marine Sources
  - 3.5.2 Production
    - 3.5.2.1 Types of quarry
    - 3.5.2.2 Armourstone blast design
    - 3.5.2.3 Selection in the quarry
  - 3.5.3 Handling
  - 3.5.4 Transportation
- 3.6 Other materials
  - 3.6.1 Clay
  - 3.6.2 Sand
  - 3.6.3 Gravel
  - 3.6.4 Unbound aggregate
  - 3.6.5 Grass and reed and other vegetative materials
  - 3.6.6 Geotextiles
  - 3.6.7 Bituminous bound materials
    - 3.6.7.1 Asphalt concrete
    - 3.6.7.2 Sand asphalt
    - 3.6.7.3 Mastic
    - 3.6.7.4 Asphalt grout
    - 3.6.7.5 Stone asphalt
  - 3.6.8 Cement bound materials
    - 3.6.8.1 Concrete
    - 3.6.8.2 Colloidal cement mortar
  - 3.6.9 Industrial by-products
  - 3.6.10 Composite materials
    - 3.6.10.1 Gabions
    - 3.6.10.2 Mattresses
    - 3.6.10.3 Block mats
- 3.7 Quality Control
  - 3.7.1 Objective
  - 3.7.2 Quality control in the Quarry
    - 3.7.2.1 Quarry faces and production
    - 3.7.2.2 Integrity of blocks
    - 3.7.2.3 Intrinsic properties
    - 3.7.2.4 Production-affected properties
  - 3.7.3 Quality control during construction
    - 3.7.3.1 Bulk placement of core materials
    - 3.7.3.2 Individual placement of armour

## Chapter 4 Physical Site Conditions and Data Collection

### 4.1 Bathymetry and morphology

- 4.1.1 General
- 4.1.2 Bathymetry and morphology related to Marine Structures
- 4.1.3 Bathymetry and morphology related to Rivers and Estuaries
  - 4.1.3.1 General
  - 4.1.3.2 Types of estuaries
  - 4.1.3.3 Types of rivers
- 4.1.4 Regime theory
- 4.1.5 Stream Power methods
- 4.1.6 Sediment transport

### 4.2 Hydraulic boundary conditions and data collection

- 4.2.1 Water levels
  - 4.2.1.1 Mean water level
  - 4.2.1.2 Tides
  - 4.2.1.3 Storm Surges
  - 4.2.1.4 Wind set-up
  - 4.2.1.5 Wave set-up
  - 4.2.1.6 Seiches
  - 4.2.1.7 Tsunami
  - 4.2.1.8 Flood waves
  - 4.2.1.9 Design extreme water level
- 4.2.2 Deep-water wave conditions
  - 4.2.2.1 Statistical properties of waves
  - 4.2.2.2 Long-term distribution of wave height and period
  - 4.2.2.3 Visual wave observations
  - 4.2.2.4 Wind statistics
  - 4.2.2.5 Spectral description of waves
  - 4.2.2.6 Sea development during storm and wave forecasting
  - 4.2.2.7 Wave forecasting in inland waters and reservoirs
  - 4.2.2.8 Deep water wave breaking and diffraction
- 4.2.3 Transformation of waves in shallow water
  - 4.2.3.1 Refraction
  - 4.2.3.2 Shoaling
  - 4.2.3.3 Diffraction
  - 4.2.3.4 Wave breaking
  - 4.2.3.5 Extreme wave heights in shallow water
  - 4.2.3.6 Reflection
  - 4.2.3.7 Wave-current interaction
- 4.2.4 Sea-bed orbital velocities
- 4.2.5 Currents and Discharges
  - 4.2.5.1 General
  - 4.2.5.2 Currents in a Marine environment
  - 4.2.5.3 Hydrology
  - 4.2.5.4 Currents in rivers
  - 4.2.5.5 Stage-discharge relationship, river discharge and velocity
  - 4.2.5.6 Hydraulic roughness
  - 4.2.5.7 Bed shear stress
  - 4.2.5.8 Turbulence
  - 4.2.5.9 Vertical velocity distribution
  - 4.2.5.10 Horizontal velocity distribution
  - 4.2.5.11 Composite cross-section
  - 4.2.5.12 Hydrographs, Duration/Exceedance and Rating curves and Stage relationships

- 4.2.5.13 River confluences and bifurcations
- 4.2.5.14 Flood waves and translation waves
- 4.2.5.15 Estuaries, including basin model and density currents
- 4.2.6 Local and secondary currents
- 4.2.7 Ship-induced water movements
  - 4.2.7.1 Water level depression, front and stern waves
  - 4.2.7.2 Secondary ship waves
  - 4.2.7.3 Wave run-up and run-down velocities
  - 4.2.7.4 Propeller jet velocities
- 4.2.8 Joint probabilities
  - 4.2.8.1 Design with joint waves and water levels
  - 4.2.8.2 Design with joint waves and currents
  - 4.2.8.3 Design with joint scour
- 4.2.9 Modelling
  - 4.2.9.1 Numerical modelling of water levels and currents
  - 4.2.9.2 Physical modelling of water levels and currents
  - 4.2.9.3 Numerical wave modelling
  - 4.2.9.4 Physical wave modelling
- 4.3 Geotechnical boundary conditions and data collection
  - 4.3.1 General aspects of planning a soil investigation programme
  - 4.3.2 Desk studies
  - 4.3.3 Preliminary soil investigations
  - 4.3.4 Detailed soil investigations

## **Chapter 5 Physical processes and design tools**

- 5.1 Hydraulic interactions
  - 5.1.1 Governing parameters
    - 5.1.1.1 Hydraulic parameters related to wave attack
    - 5.1.1.2 Hydraulic parameters related to current attack
    - 5.1.1.3 Structural parameters related to wave attack
    - 5.1.1.4 Structural parameters related to current attack
  - 5.1.2 Hydraulic response related to waves
    - 5.1.2.1 Wave Run-up and Run-down
    - 5.1.2.2 Wave Overtopping
    - 5.1.2.3 Wave Transmission
    - 5.1.2.4 Wave Reflection
  - 5.1.3 Hydraulic response related to current
    - 5.1.3.1 Velocity distribution and bed shear stress
    - 5.1.3.2 Water level
    - 5.1.3.3 Turbulence
  - 5.1.4 Hydraulic response to river banks
    - 5.1.4.1 Vertical velocity distribution in rivers
    - 5.1.4.2 Transverse velocity distribution and river bends
    - 5.1.4.3 Backwater effects
  - 5.1.5 Hydraulic response to rockfill dams
    - 5.1.5.1 Types of flow
    - 5.1.5.2 Discharge relationships and velocities
    - 5.1.5.3 Boundary conditions for closure design
    - 5.1.5.4 Comparison of vertical and horizontal closure
    - 5.1.5.5 Discharge coefficients

## 5.2 Structural response to hydraulic loading

- 5.2.1 Stability concepts and parameters
  - 5.2.1.1 Critical shear concept
  - 5.2.1.2 Critical or permissible velocity method
  - 5.2.1.3 Critical wave height method
  - 5.2.1.4 Critical head or height of overtopping
  - 5.2.1.5 Critical discharge method
  - 5.2.1.6 Transfer relationships
  - 5.2.1.7 General design formulae
- 5.2.2 Structural response related to waves
  - 5.2.2.1 Armour layers
  - 5.2.2.2 Underlayers and filters
  - 5.2.2.3 Crest and rear armour (low-crested structures)
  - 5.2.2.4 Crown walls
  - 5.2.2.5 Toe protection
  - 5.2.2.6 Breakwater head
  - 5.2.2.7 Dynamically stable slopes (berm breakwaters and shingle beaches)
  - 5.2.2.8 Stepped and composite slopes
  - 5.2.2.9 Breakwater armour units
  - 5.2.2.10 Composite systems
  - 5.2.2.11 Longshore transport
  - 5.2.2.12 Combined current and wave attack
- 5.2.3 Structural response related to current
- 5.2.4 Structural response of river banks
  - 5.2.4.1 Stability under current attack
  - 5.2.4.2 Stability under wind-induced wave attack
  - 5.2.4.3 Stability under ship-induced wave attack
- 5.2.5 Structural response of rockfill dams
  - 5.2.5.1 General
  - 5.2.5.2 Vertical closure method
  - 5.2.5.3 Horizontal closure method
  - 5.2.5.4 Combined closure method
  - 5.2.5.5 Overflow dams and downstream armour
- 5.2.6 Structural response, prediction and measures to ship-induced waves

## 5.3 Scour

- 5.3.1 Types of scour and relevant aspects
- 5.3.2 Prediction of general scour
  - 5.3.2.1 General scour
  - 5.3.2.2 Constriction scour
  - 5.3.2.3 Confluence scour
  - 5.3.2.4 Bend scour
- 5.3.3 Prediction of local scour
  - 5.3.3.1 Time development of scour (clear-water scour)
  - 5.3.3.2 Reduction of scour depth (live-bed scour)
  - 5.3.3.3 Maximum scour depths at various types of structures
  - 5.3.3.4 Upstream slope of a scour hole
- 5.3.4 Scour near marine structures
  - 5.3.4.1 Incidence and extent of scour
  - 5.3.4.2 Simple prediction methods
  - 5.3.4.3 Prediction methods for shingle beaches
- 5.3.5 Measures to prevent scour

- 5.3.5.1 General measures against scour
- 5.3.5.2 Measures against scour near marine structures
- 5.4 Modelling and simulation of hydraulic interactions
  - 5.4.1 Types of models and modelling
  - 5.4.2 Numerical models
    - 5.4.2.1 Numerical modelling of currents and water levels
    - 5.4.4.2 Numerical modelling of waves
    - 5.4.4.3 Numerical modelling of morphology
    - 5.4.4.4 Other numerical models
  - 5.4.3 Scale models
    - 5.4.3.1 Wave modelling with scale models
    - 5.4.3.2 Use of scale models for water levels and currents
- 5.5 Geotechnical interactions
  - 5.5.1 Identification of geotechnical interactions
    - 5.5.1.1 Survey of relevant aspects
    - 5.5.1.2 Relation between the different aspects and the structure
    - 5.5.1.3 Approach of geotechnical analysis
  - 5.5.2 Soil and rock properties
    - 5.5.2.1 Total stress and effective stress
    - 5.5.2.2 Effective stress and deformations in general
    - 5.5.2.3 Isotropic compression
    - 5.5.2.4 Shear deformation
    - 5.5.2.5 Dilatation and contraction in granular materials
    - 5.5.2.6 Sensitivity of clays and softening
    - 5.5.2.7 Modelling of soil properties and selection of relevant parameters
  - 5.5.3 Geotechnical parameters
    - 5.5.3.1 Survey of relevant (rock) parameters
    - 5.5.3.2 Compressibility, shear modulus and Poisson ratio
    - 5.5.3.3 Permeability
    - 5.5.3.4 Friction angle
- 5.6 Geotechnical response
  - 5.6.1 Pore pressures due to stationary and quasi-stationary loads
  - 5.6.2 Pore pressures due to non-stationary loads
    - 5.6.2.1 Survey
    - 5.6.2.2 Pore pressures dominated by phreatic storage
    - 5.6.2.3 Pore pressures due to elastic storage
    - 5.6.2.4 Pore pressures due to plastic volume strain of the skeleton
    - 5.6.2.5 Earthquake-induced liquefaction
  - 5.6.3 Structure and subsoil stability
    - 5.6.3.1 General
    - 5.6.3.2 Example of results with Bishop analysis
    - 5.6.3.3 Sliding stability of revetments under wave attack
  - 5.6.4 Settlement of rockfill and compressible soil
    - 5.6.5 Erosion of fine particles or filter stability
      - 5.6.5.1 General
      - 5.6.5.2 Internal erosion of granular material
      - 5.6.5.3 Interface stability of a granular filter
      - 5.6.5.4 Interface stability of a geotextile filter
      - 5.6.5.5 Requirements on filter permeability

- 5.6.5.6 Piping
- 5.6.6 Dynamic response
  - 5.6.6.1 Dynamic response due to wave impacts and earthquakes
  - 5.6.6.2 Example of dynamic and other of geotechnical interactions responses to earthquake
- 5.7 Numerical and physical geotechnical modelling
  - 5.7.1 General
  - 5.7.2 Joint modelling of hydraulic and geotechnical processes
  - 5.7.3 Coupling of two phases and application of one-phase models
  - 5.7.4 Modelling of porous flow
  - 5.7.5 Modelling of deformation and stability

## Chapter 6 Marine Structures

- 6.1 Rubble mound breakwaters
  - 6.1.1 Definitions
  - 6.1.2 Layout
    - 6.1.2.1 Berth protection
    - 6.1.2.2 Protection to access channel
    - 6.1.2.3 Reduction of cost for maintenance dredging
  - 6.1.3 General design considerations for breakwater cross-section
    - 6.1.3.1 Cross-section concept generation, selection and detailing
    - 6.1.3.2 Data collection and boundary conditions
    - 6.1.3.3 Materials availability
    - 6.1.3.4 Construction considerations
  - 6.1.4 Structure-specific design aspects
    - 6.1.4.1 Conventional rubble mound
    - 6.1.4.2 Rubble mound with monolithic crown-wall
    - 6.1.4.3 Berm of S-slope breakwater
    - 6.1.4.4 Reef breakwater
    - 6.1.4.5 Low-crested and submerged breakwaters
    - 6.1.4.6 Caisson-type breakwater
  - 6.1.5 Construction aspects
  - 6.1.6 Cost aspects and project optimization
    - 6.1.6.1 Production aspects of the cost of breakwaters
    - 6.1.6.2 Cost aspects related to activities at the site of the structure
    - 6.1.6.3 Examples of cost optimization in design and construction
- 6.2 Sea walls and shoreline protection structures
  - 6.2.1 Definitions
  - 6.2.2 Plan layout and overall concept selection
    - 6.2.2.1 Functional requirements
    - 6.2.2.2 Position of shoreline
    - 6.2.2.3 Layout options and design
    - 6.2.2.4 Effect of selected concept and layout on beaches and coastlines
    - 6.2.2.5 Environmental and amenity considerations
  - 6.2.3 General considerations for cross-section design of rock coastal structures
    - 6.2.3.1 Functional requirements of cross-section
    - 6.2.3.2 Physical boundary conditions
    - 6.2.3.3 Materials availability
    - 6.2.3.4 Material supply

- 6.2.3.5 Construction considerations
- 6.2.3.6 Maintenance considerations
- 6.2.3.7 Selection and design of armour layer (revetment)
  
- 6.2.4 Structure-specific design aspects
  - 6.2.4.1 Conventional revetment or revetted mound (dike)
  - 6.2.4.2 Scour protection of vertical wall
  - 6.2.4.3 Bastion groyne
  - 6.2.4.4 Offshore breakwater
  - 6.2.4.5 Fishtailed breakwater
  - 6.2.4.6 L-shaped and T-shaped breakwaters
  - 6.2.4.7 Sill or submerged breakwater
  
- 6.2.5 Construction aspects
  
- 6.3 Gravel beaches
  - 6.3.1 Definitions
  - 6.3.2 Functions and overall concept selection
  - 6.3.3 Design process
  - 6.3.4 Coastal processes
  - 6.3.5 Gravel beach profile
  - 6.3.6 Construction and cost aspects
  - 6.3.7 Monitoring and re-nourishment
  
  - 6.3.8 Cost optimisation
    - 6.3.8.1 Influence of location of borrow area and grading of borrow material
    - 6.3.8.2 Site conditions during construction
    - 6.3.8.3 Volume of gravel required per m' beach length
  
- 6.4 Rockfill in offshore engineering
  - 6.4.1 Functional analysis
  
  - 6.4.2 Principal design considerations
    - 6.4.2.1 Design approach
    - 6.4.2.2 Hydraulic stability of rockfill
    - 6.4.2.3 Geotechnical stability
    - 6.4.2.4 Impact of falling objects
    - 6.4.2.5 Dragging anchors and fishing-gear
    - 6.4.2.6 Freespans
    - 6.4.2.7 Upheaval buckling
  
  - 6.4.3 Construction aspects
    - 6.4.3.1 Construction methods
    - 6.4.3.2 Impact of dumped rock
    - 6.4.3.3 Survey
  
  - 6.4.4 Cost aspects

## Chapter 7 Closure works

- 7.1 Introduction
  - 7.1.1 Definitions and topics to be discussed in this Chapter
  - 7.1.2 Design methodology and criteria
  - 7.1.3 Construction aspects
  - 7.1.4 Inspection and Maintenance
  
- 7.2 Closure dams
  - 7.2.1 General features

- 7.2.2 Estuary closures
  - 7.2.2.1 Purpose, data collection, estuary studies, surveys and model testing
  - 7.2.2.2 Types of rock-based structures in estuary closures and their functions
  - 7.2.2.3 Plan layout and overall concept selection
  - 7.2.2.4 General considerations for cross-section design
  - 7.2.2.5 Examples of structure-specific design aspects
- 7.2.3 River closures
  - 7.2.3.1 Purpose, data collection, river studies and surveys, model testing
  - 7.2.3.2 Typical characteristics of (partial) river closures and cofferdams
  - 7.2.3.3 Plan layout and overall concept selection
  - 7.2.3.4 General considerations for cross-section design
  - 7.2.3.5 Structure-specific design aspects
  - 7.2.3.6 Examples and case histories
- 7.3 Estuary dams
  - 7.3.1 General
  - 7.3.2 Evaluation of closure methods for estuaries
- 7.4 Reservoir dams
  - 7.4.1 Functions of reservoirs
  - 7.4.2 Outline and planning of a reservoir dam project
  - 7.4.3 Types of dams and construction materials used
  - 7.4.4 Earthfill dams
  - 7.4.5 Rockfill dams
- 7.5 Barriers, sills, weirs, barrages and diversion dams
  - 7.5.1 General
  - 7.5.2 Barriers
  - 7.5.3 Sills
  - 7.5.4 Weirs and Barrages
  - 7.5.5 Diversion dams
- 7.6 Diversion passages and regulating structures in dams
  - 7.6.1 Types and functions
  - 7.6.2 Diversion passages
  - 7.6.3 Regulating structures
    - 7.6.3.1 Spillways and outlets in reservoir dams
    - 7.6.3.2 Sluices in estuary dams
  - 7.6.4 Modelling in relation to flow pattern, scour and bed protection

## **Chapter 8 Inland Waterway Structures**

- 8.1 Introduction
  - 8.1.1 Context of topics to be discussed in this Chapter
  - 8.1.2 Types of inland waterway structures and functions
  - 8.1.3 Design methodology
  - 8.1.4 Construction aspects
  - 8.1.5 Inspection and Maintenance

## 8.2 River Training works

- 8.2.1 Types of river training structures and functions
  - 8.2.1.1 Flood protection
  - 8.2.1.2 Navigation
  - 8.2.1.3 Bank protection and longitudinal dikes
- 8.2.2 Data Collection, river surveys and studies, model testing
  - 8.2.2.1 Example of data collection of a major river training project
  - 8.2.2.2 Example of model testing for a major river training project
- 8.2.3 Plan layout and overall concept selection
  - 8.2.3.1 General
  - 8.2.3.2 Spur-dikes
  - 8.2.3.3 Longitudinal dikes or guide banks (guide bunds)
  - 8.2.3.4 Bank Protection
- 8.2.4 General considerations for cross-section design
  - 8.2.4.1 Functional requirements of cross-section and non-technical boundary conditions
  - 8.2.4.2 Hydraulic and geotechnical boundary conditions, including scour
  - 8.2.4.3 Materials availability
  - 8.2.4.4 Materials supply
  - 8.2.4.5 Construction considerations
  - 8.2.4.6 Maintenance considerations
- 8.2.5 Structure-specific design aspects
  - 8.2.5.1 Design of the revetment of river training structures
  - 8.2.5.2 Geometrical design of river training structures
  - 8.2.5.3 Stability of the toe of revetments
  - 8.2.5.4 Determination of hydraulic and other loads
  - 8.2.5.5 Sectioning of slope and revetment
  - 8.2.5.6 Selection of revetment system
  - 8.2.5.7 Dimensioning of revetment
  - 8.2.5.8 Transitions
- 8.2.6 Example of selecting a revetment system using a M.C.A.
  - 8.2.6.1 Available construction materials
  - 8.2.6.2 Types of slope protection
  - 8.2.6.3 Selection of type of protection
- 8.2.7 Example of the structural design of the cover layer
  - 8.2.7.1 Deterministic calculations
  - 8.2.7.2 Risk considerations
  - 8.2.7.3 Probabilistic calculations

## 8.3 Bed protection, revetment and lining in navigation and water conveyance canals

- 8.3.1 Differences between rivers and canals
- 8.3.2 Types of rock-based structures, functions of canals and rock-based structures
  - 8.3.2.1 Navigation canals
  - 8.3.2.2 Water conveyance canals
- 8.3.3 Plan layout and overall concept selection
- 8.3.4 Considerations for cross-sectional design
  - 8.3.4.1 General
  - 8.3.4.2 Design parameters for slope/bed protection as a function of overall canal design
  - 8.3.4.3 Physical boundary conditions

- 8.3.4.4 Materials availability and supply
- 8.3.4.5 Construction considerations
- 8.3.4.6 Maintenance considerations
- 8.3.4.7 Requirements to be fulfilled by revetment layer
- 8.3.5 Structure-specific design aspects
- 8.3.6 Example design of slope protection in navigation canal
  - 8.3.6.1 Background and data
  - 8.3.6.2 Calculation of hydraulic loads
  - 8.3.6.3 Determination of cover layer on slopes
  - 8.3.6.4 Final remarks, sensitivity
- 8.4 Special structures
  - 8.4.1 General

## Chapter 9 Construction aspects

- 9.1 Introduction
- 9.2 Review of types of equipment
  - 9.2.1 General
  - 9.2.2 Direct dumping of bulk material with land-based equipment
  - 9.2.3 Controlled placement with land-based equipment
  - 9.2.4 Direct dumping of bulk material with waterborne equipment
  - 9.2.5 Controlled placement with waterborne equipment
  - 9.2.6 Working conditions
    - 9.2.6.1 Working conditions for land-based operations
    - 9.2.6.2 Working conditions for waterborne operations
  - 9.2.7 Tolerances
    - 9.2.7.1 Tolerances for land-based operations
    - 9.2.7.2 Tolerances for waterborne operations
  - 9.2.8 Control aspects
- 9.3 Specific aspects of site and location
  - 9.3.1 General
  - 9.3.2 Infrastructure
  - 9.3.3 Logistics
  - 9.3.4 Accommodation
  - 9.3.5 Availability of labour, equipment and materials
  - 9.3.6 Import and export restrictions
  - 9.3.7 Other legal aspects (taxes, permits)
  - 9.3.8 Environmental aspects
- 9.4 Site preparations
  - 9.4.1 Stock, production and repair areas
  - 9.4.2 Loading/unloading facilities
  - 9.4.3 Site offices
  - 9.4.4 Setting and testing of level datum and positioning system
  - 9.4.5 Clearing and maintenance
- 9.5 Positioning systems and survey methods
  - 9.5.1 General
  - 9.5.2 Review and applicability of positioning systems

- 9.5.3 Sounding systems
- 9.5.4 Diver inspection
- 9.6 Quality assurance
- 9.7 Construction aspects and work methods of a general nature
  - 9.7.1 General
  - 9.7.2 Soil conditions
  - 9.7.3 Erosion and sedimentation aspects
  - 9.7.4 Matching demand for stone to quarry fragmentation curves
  - 9.7.5 Construction methods for bed and bank protection
    - 9.7.5.1 Introduction
    - 9.7.5.2 Bed protection
    - 9.7.5.3 Bank protection
  - 9.7.6 Construction of the core
  - 9.7.7 Construction of filter layers
    - 9.7.7.1 Granular filters
    - 9.7.7.2 Geotextile mattresses
  - 9.7.8 Construction of armour layers
- 9.8 Construction of breakwaters
  - 9.8.1 General
  - 9.8.2 Land-based breakwater construction
  - 9.8.3 Waterborne breakwater construction
  - 9.8.4 Combination of land-based and waterborne construction
  - 9.8.5 Summary of considerations on the use of land-based equipment versus waterborne operation for breakwater construction
- 9.9 Construction of seawalls
- 9.10 Construction of gravel beaches
- 9.11 Construction of groynes and detached breakwaters
- 9.12 Construction of pipeline protections
- 9.13 Construction of artificial islands
- 9.14 Construction of rockfill closure dams
- 9.15 Construction of riprap slope protection on earthfill and rockfill reservoir dams
- 9.16 Construction of bank protections and river training works
  - 9.16.1 General
  - 9.16.2 River bed protections without geotextile fabric
  - 9.16.3 Protections works under water combined with fascine mattress
  - 9.16.4 Some examples of work methods of typical protection works in rivers
    - 9.16.4.1 Construction method in tidal conditions for a rock slope protection on a sandfill
    - 9.16.4.2 Spur-dikes and river alignment
    - 9.16.4.3 Construction with rock/gravel in combination with other protective elements

## **Chapter 10 Maintenance**

### **10.1 Maintenance policy and strategy**

### **10.2 Monitoring**

#### **10.2.1 Types of monitoring**

#### **10.2.2 Frequency of monitoring**

### **10.3 Appraisal of structure performance**

### **10.4 Repair/replacement construction methods**

## **Appendices**

### **A Design of an Estuary Closure; Case study**

#### **A1 Introduction**

#### **A2 Description of the design**

#### **A3 The handling of uncertainties**

#### **A4 Fault tree analysis**

#### **A5 Failure mechanisms and reliability functions**

#### **A6 Deterministic design**

#### **A7 Results of probabilistic calculations**

#### **A8 Probabilistic design using different design criteria**

### **B Hydraulic data measurement and instrumentation**

#### **B1 Bathymetric Surveys**

#### **B2 Water Level Measurement**

#### **B3 Current Measurements**

#### **B4 Wave Measurements**

### **C Geotechnic data measurement and instrumentation**

#### **C1 Site investigation methods**

#### **C2 Site investigations on water**

#### **C3 Laboratory tests**

### **D European, British and Dutch legislation/authorities/ designated sites relevant to environmental assessment of projects involving the use of rock in hydraulic engineering**

#### **D1 Legislation/Guidance Documents**

#### **D2 Statutory Consultees (U.K.)**

#### **D3 Sensitive Locations (U.K.)**
