

introduction to
veterinary genetics

SECOND EDITION

F. W. NICHOLAS

Blackwell
Publishing

Contents

Preface	xi
Preface to the 1st edition	xii
Acknowledgements	xiii
1 Basic genetics	1
Chromosomes	1
Meiosis and mitosis	4
The biochemistry of inheritance	11
What is a gene?	18
Gene regulation	22
Mutation	23
Genes, alleles, and loci	24
Simple or Mendelian inheritance	25
Linkage	27
Inactivation	32
Types of DNA	35
Further reading	36
Appendix 1.1 Banded karyotypes of domestic species	37
2 Molecular biology	43
Restriction enzymes	43
Recombinant DNA and DNA cloning	45
Complementary DNA	49
DNA sequencing	49
Polymerase chain reaction (PCR)	52
Southern analysis and related technologies	55
DNA microarrays (DNA chips)	55
The detection of variation in base sequence	57
Veterinary diagnosis	60
Variable number of tandem repeats (VNTR), DNA fingerprints, and microsatellites	60
Single nucleotide polymorphisms (SNPs)	65
Gene mapping	66
Production of polypeptide from cloned DNA	68
Transgenesis	71
Antisense technology	73
Further reading	74

3	Single-gene disorders	75
	Inborn errors of metabolism	75
	Sex-limited inheritance	77
	Genetical heterogeneity of disease	78
	Type of gene action and type of disease	80
	Phenocopies	81
	A sample of single-gene disorders	82
	Further reading	86
	Appendix 3.1 A sample of single-gene disorders in animals	86
4	Chromosomal aberrations	93
	Abnormal chromosome number	93
	Abnormal chromosome structure	97
	Chromosomal aberrations in cancer	102
	Evolution of karyotypes	102
	Interspecific hybridization	103
	Freemartins	103
	Biological basis of sex	105
	Classification of intersex	106
	A sample of chromosomal aberrations	107
	Further reading	107
	Appendix 4.1 A sample of chromosomal aberrations in animals	108
5	Single genes in populations	110
	Gene and genotype frequencies	110
	Random mating	111
	The Hardy–Weinberg law	111
	Extensions to the Hardy–Weinberg law	114
	Selection and mutation	115
	Genetic drift and the founder effect	122
	Further reading	123
6	Familial disorders not due to a single gene	124
	Liability and threshold	124
	The multifactorial model	124
	More than one threshold	126
	Some final points	128
	Further reading	133
7	Is it inherited?	134
	General evidence for a genetic aetiology	134
	The four types of simple, Mendelian inheritance	135
	Studying and analysing the data	137
	Further reading	140

8 Immunogenetics	141
Antibodies	142
Red-cell antigens	143
The major histocompatibility complex (MHC)	145
Further reading	152
9 Pharmacogenetics	153
Genetic polymorphisms affecting drug metabolism	153
Genetics and anaesthesia	153
Warfarin resistance	155
Multifactorial pharmacogenetics	156
Further reading	158
10 Hosts, parasites, and pathogens	159
Host–pathogen interactions	159
Resistance in hosts	163
Resistance in parasites and pathogens	164
Control of parasites and pathogens	168
Increasing the level of resistance in hosts	170
Further reading	172
11 Single genes in animal breeding	173
Coat colour	173
Carpet wool	177
Prolificacy in sheep	177
Polledness	178
Muscular hypertrophy in cattle and sheep	178
Dwarf poultry	179
Genes for sexing chickens	179
Pedigree checking	180
Further reading	182
12 Relationship and inbreeding	183
The inbreeding coefficient	183
Relationship	184
The inbreeding coefficient revisited	186
A general expression for relationship and inbreeding	186
The base population	187
Inbreeding in populations	188
Inbreeding depression	188
Further reading	190
13 Quantitative variation	191
Quantitative traits	191
The performance of an individual animal	193

	The differences between animals	195
	Heritability	196
	Correlations between traits	198
	Quantitative trait loci (QTL)	200
	Further reading	201
14	Selection between populations	202
	Comparison between populations	202
	Genotype–environment interaction	203
	Further reading	205
15	Selection within populations	206
	Estimated breeding values and accuracy of selection	206
	Clues to a candidate’s breeding value for a trait	207
	Combining clues from more than one source	207
	Best linear unbiased prediction (BLUP)	209
	Correlated traits	210
	Selection for more than one trait	211
	The importance of inbreeding and genetic drift	213
	Sire-reference schemes	214
	Marker-assisted selection (MAS)	214
	Further reading	215
16	Breed structure	216
	The traditional pyramid	216
	Closed-nucleus breeding schemes	217
	Open-nucleus breeding schemes	217
	Further reading	219
17	Crossing	220
	Regular crossing	220
	Crossing to produce a synthetic	226
	Grading-up	227
	Further reading	231
18	Selection and regular crossing	232
	Selection	232
	Selection and regular crossing	232
	Further reading	234
19	Biotechnology and the future	235
	Artificial insemination (AI)	235
	Multiple ovulation and embryo transfer (MOET)	236
	<i>In vitro</i> maturation (IVM) and <i>in vitro</i> fertilization (IVF) of ova	237
	Control of sex ratio	238

Recombinant proteins	238
Transgenesis	239
Animal cloning	240
Further reading	243
20 Conservation genetics	244
Measurement of genetic diversity within populations	244
Measurement of genetic diversity among populations	245
Importance of genetic diversity	247
Loss of genetic diversity	248
Conservation of genetic diversity	249
Further reading	252
21 Genetic and environmental control of inherited disorders	254
Environmental control of inherited disorders	254
Genetic control of single-gene disorders	257
DNA markers in the control of single-gene disorders	262
Gene therapy	265
Genetic control of multifactorial disorders	266
Genetic control – some final points	267
Crossing: thinking outside the square	269
Further reading	271
Index	273
