Neural and Fuzzy Logic Control of Drives and Power Systems

Newnes

Contents

Preface *xi*

1 Control systems **1**
1.1 Control theory: historical review 1
1.2 Introduction to control systems 2
1.2.1 Classification 2
1.2.2 Characteristics of control systems 4
1.3 Control systems for a.c. drives 5
1.3.1 The objects of control systems in a.c. drives 5
1.3.2 Basic principle of microcomputer control 6

2 Modern control systems design using CAD techniques **10**
2.1 Electronic design automation (EDA) 10
2.2 Application specific integrated circuit (ASIC) basics 12
2.3 Field programmable gate arrays (FPGAs) 14
2.4 ASICs for power systems and drives 16

3 Electric motors and power systems **18**
3.1 Electric motors 18
3.2 Power systems 19
3.3 Pulse width modulation 22
3.4 The space vector in electrical systems 26
3.5 Induction motor control 28
3.5.1 Space vector model of three-phase induction motor 28
3.5.2 Induction motor control strategies 34
3.5.3 Scalar control 37
3.5.4 Vector control 41
3.5.5 Rotor flux orientation 42
3.5.6 Stator and airgap flux orientation 46
3.5.7 Direct torque control 47
3.5.8 Sensorless vector control schemes 47
3.6 Synchronous generators control 51

4 Elements of neural control **56**
4.1 Neurone types 56
4.2 Artificial neural networks architectures 59
4.3 Training algorithms 61
4.3.1 The error back-propagation algorithm 62
4.3.2 Algorithms derived from the back-propagation method 65
4.3.3 Training algorithms for neurones with step activation functions 66

4.3.4 The Voronoi diagram algorithm 67
4.4 Control applications of ANNs 69
4.5 Neural network implementation 71
4.5.1 Analogue hardware implementation 71
4.5.2 Digital hardware implementation 73
4.5.3 Hybrid implementation techniques 74
4.5.4 Software versus hardware implementations 75

5 Neural FPGA implementation 77
5.1 Neural networks design and implementation strategy 77
5.1.1 General implementation principles 77
5.1.2 Model digitisation 79
5.1.3 Digital model implementation using logic gates 84
5.2 Universal programs – FFANN hardware implementation 95
5.3 Hardware implementation complexity analysis 98
5.3.1 Results previously reported in the literature 99
5.3.2 The analysis of the new implementation method 103

6 Fuzzy logic fundamentals 113
6.1 Historical review 113
6.2 Fuzzy sets and fuzzy logic 114
6.3 Types of membership functions 116
6.4 Linguistic variables 117
6.5 Fuzzy logic operators 117
6.6 Fuzzy control systems 118
6.6.1 Fuzzifier 119
6.6.2 Knowledge base 119
6.6.3 Rule base 119
6.6.4 Defuzzifier 120
6.7 Fuzzy logic in power and control applications 121

7 VHDL fundamentals 123
7.1 Introduction 123
7.1.1 Top-down design methodology 123
7.1.2 Terminology 125
7.1.3 Behavioural and structural design 125
7.2 VHDL design units 126
7.2.1 Entity 127
7.2.2 Architecture 128
7.2.3 Configuration 129
7.2.4 Package 131
7.2.5 Package body 131
7.3 Libraries, visibility and state system in VHDL 131
7.3.1 Libraries 131
7.3.2 Visibility 132
7.3.3 State system 133
7.3.4 VHDL simulation 134

7.4 Sequential statements 135
7.4.1 Wait 136
7.4.2 If-then-else 137
7.4.3 Case 138
7.4.4 Loop 139
7.4.5 Assert 140
7.5 Concurrent statements 141
7.5.1 Process 141
7.5.2 Signal assignment 142
7.5.3 Component instantiation 144
7.5.4 Generate 144
7.5.5 Assert 145
7.6 Functions and procedures 146
7.6.1 Functions 146
7.6.2 Function body 146
7.6.3 Procedures 148
7.6.4 Procedure body 150
7.7 Advanced features in VHDL 151
7.7.1 Attributes 151
7.7.2 Overloading 152
7.7.3 Passive processes 153
7.7.4 Textio 153
7.8 Summary 154

CASE STUDIES

8 Neural current and speed control of induction motors 159
8.1 The induction motor equivalent circuit 159
8.2 The current control algorithm 161
8.2.1 The switching strategy 161
8.2.2 The adopted neural architecture 167
8.2.3 The automated design process 171
8.2.4 The on-line inductance estimation 172
8.2.5 Conditions for accurate current control 175
8.2.6 Current control implementation methods 176
8.2.7 Current control simulation 178
8.3 The new sensorless motor control strategy 183
8.3.1 Speed estimation algorithms 185
8.3.2 The novel speed control algorithm 188
8.3.3 The complete control scheme 199
8.4 Induction motor controller VHDL design 199
8.4.1 The reference speed calculator and sine wave generator (Tier 0) 201
8.4.2 The multiplication and algebraic calculation (Tier 1) 212
8.4.3 The PWM generation and on-line inductance estimation (Tier 2) 219
8.4.4 The implementation of the speed control strategy (Tier 3) 224

8.4.5 The complete motor controller simulations 226
8.5 FPGA controller experimental results 227
8.5.1 The drive system 227
8.5.2 Current and voltage control tests 231
8.5.3 Speed control tests 233

9 Fuzzy logic control of a synchronous generator set 237
9.1 System representation 237
9.1.1 Rectifier circuit 237
9.1.2 Synchronous generator 239
9.1.3 Equivalent circuit model 241
9.1.4 The generator–rectifier model 242
9.1.5 The diesel engine 245
9.2 VHDL modelling 248
9.2.1 PWM inverter design and analysis 250
9.2.2 Fuzzy synchronous generator control 251
9.2.3 Rule base design 256
9.2.4 VHDL description 259
9.2.5 Simulations 264
9.3 FPGA implementation 270
9.3.1 The divider 271
9.3.2 Analysis of binary integer division 272
9.3.3 Binary integer division algorithm 273
9.3.4 Design optimisation 275
9.3.5 Implementation 284
9.4 System assembly and experimental tests 285
9.4.1 The fuzzy logic controller (FLC) 286
9.4.2 The PWM controller 287
9.4.3 Experimental results 290
9.4.4 Conclusions 292

Final notes 293

10 References 294

11 Appendices 305
11.1 Appendix A – C++ code for ANN implementation 305
11.1.1 CONV_NET.CPP 305
11.1.2 OPTIM.CPP 314
11.1.3 VHDL_TR.CPP 322
11.1.4 MEMMANAG.H 329
11.1.5 MATRIX.H 331
11.2 Appendix B – C++ programs for PWM generation 333
11.2.1 ANGLES.CPP 333
11.2.2 REGIONS.CPP 334
11.2.3 CTRL.CPP 338

11.3 Appendix C – Subnetworks VHDL models 341
11.3.1 The angle subnetwork 341
11.3.2 The position subnetwork 350
11.4 Appendix D – VHDL model of the sine wave ROM 355
11.4.1 SIN_ROM.CPP 355
11.5 Appendix E – VHDL code for simulation 357
Plant models for simulation 357
11.5.1 Generator and rectifier model 357
11.5.2 Diesel engine model 359
Fuzzy logic controller 360
11.5.3 Input interface 360
11.5.4 Fuzzifier 361
11.5.5 Rule base and inference engine 362
11.5.6 Defuzzifier and output interface 366
11.5.7 Top hierarchy of FLC 367
Test-benches and simulations 370
11.5.8 Delay 370
11.5.9 Simulator 370
11.5.10 Test-bench for 'Sim' 373
11.6 Appendix F – VHDL code for synthesis 374
Fuzzy logic controller 374
11.6.1 Input interface 374
11.6.2 Fuzzifier 376
11.6.3 Inference engine 379
11.6.4 Defuzzifier 380
11.6.5 Divider 382
11.6.6 Top hierarchy component of FLC 385
11.7 Appendix G – PWM controllers 389
11.7.1 C++ program for PWM waveform generation 389
11.7.2 PIC assembly code to control SA828 393
