Foreword xvii

1 The Internet, Email, Ebusiness and the Worldwide Web (www) 1

1.1 In the beginning — ARPANET 1
1.2 The emergence of layered protocols for data communication 2
1.3 SNA (systems network architecture) 3
1.4 DECnet 5
1.5 Other mainframe computer manufacturers 5
1.6 X.25 (ITU-T recommendation X.25) 5
1.7 DTE (data terminal equipment), DCE (data circuit-terminating equipment), line interfaces and protocols 7
1.8 UNI (user-network interface), NNI (network-network interface) and INI (inter-network interface) 10
1.9 Open systems interconnection (OSI) 11
1.10 EDI (electronic data interchange) 17
1.11 CompuServe, prestel, minitel, BTx (Bildschirmtext) and teletex 18
1.12 The role of UNIX in the development of the Internet 20
1.13 The appearance of the PC (personal computer) 20
1.14 Local area networks (LANs) 20
1.15 LAN servers, bridges, gateways and routers 22
1.16 Why did IP win through as the standard for 'open' communication? 24
1.17 The development and documentation of IP (Internet protocol) and the Internet 24
1.18 Electronic mail and the domain name system (DNS) 24
1.19 html, WindowsNT and the Worldwide Web 26
1.20 Internet addresses and domain names 26
1.21 What are ISPs (Internet service providers) and IAPs (Internet access providers)? 27
1.22 The emergence of ebusiness 27

2 Fundamentals of Data Communication and Packet Switching 29

2.1 The binary code 29
2.2 Electrical or optical representation and storage of binary code numbers 30
2.3 Using the binary code to represent textual information 31
2.4 ASCII (American standard code for information interchange) 31
2.5 EBCDIC and extended forms of ASCII 34
2.6 Use of the binary code to convey graphical images 35
2.7 Decoding binary messages — the need for synchronisation and for avoiding errors 36
2.8 Digital transmission 37
2.9 Modulation of digital information over analogue media using a modem 38
2.10 Detection and demodulation — errors and eye patterns 44
2.11 Reducing errors — regeneration, error detection and correction 48
2.12 Synchronisation 51
2.13 Packet switching, protocols and statistical multiplexing 55
2.14 Symmetrical and asymmetrical communication: full duplex and all that! 60
2.15 Serial and parallel communication 62
2.16 The problem of long lines — the need to observe the maximum line length 62

3 Basic Data Networks and Protocols 67

3.1 The basic components of a data network 67
3.2 Layer 1 — physical layer interface: DTE/DCE, line interfaces and protocols 70
3.3 Layer 2 — data link layer 96
3.4 Layer 3 — network layer and network layer addresses 103
3.5 Layer 4 — transport layer protocol 111
3.6 Layers 5–7 — higher layer protocols 114
3.7 Protocol stacks and nested protocol control information (PCI) 117
3.8 Real networks and protocol stack representations 119
3.9 Protocol encapsulation 119
3.10 Control and management protocols 120
3.11 Propagation effects affecting protocol choice and network design and operation 122

4 Local Area Networks (LANs) 125

4.1 The different LAN topologies and standards 125
4.2 Ethernet (CSMA/CD; IEEE 802.3) 126
4.3 Ethernet LAN standards (IEEE 802.3 and 802.2) 128
4.4 Ethernet LAN datalink layer protocols — LLC and MAC 129
4.5 Ethernet physical layer — basic functions of the physical layer signalling (PLS) 135
4.6 Ethernet hubs (half duplex repeaters) 136

4.7 Alternative physical layers — ethernet, fast ethernet and gigabit ethernet 138
4.8 LAN segments and repeaters — extending the size of a single collision domain 142
4.9 LAN switches — extending coverage and managing traffic in LAN networks 145
4.10 Other types of LAN (token ring and token bus) 149
4.11 LAN operating software and LAN servers 156
4.12 Interconnection of LANs — bridges, switches, VLANs, routers and gateways 157

5 WANs, Routers and the Internet Protocol (IP) 165
5.1 WANs (wide area networks), routers, Internet protocol (IP) and IP addresses 165
5.2 Main functions of routers 167
5.3 Unicast, broadcast, multicast and anycast forwarding 172
5.4 Routing table format — static and dynamic routing 173
5.5 Routing table conventions 176
5.6 Simple IP routing control mechanisms: time-to-live (ttl) and hop limit fields 177
5.7 Internet protocol version 4 (IPv4) 178
5.8 ICMP (Internet control message protocol) 184
5.9 Internet addressing (IPv4) 187
5.10 Differentiated services (Diffserv and DS field) 193
5.11 Internet protocol version 6 (IPv6) 198
5.12 ICMP for IPv6 204
5.13 IPv6 addressing 205
5.14 Multicasting 209

6 Routing Tables and Protocols 215
6.1 Routing tables: static and dynamic routing — a recap 215
6.2 Choosing the best route by comparing the routing distance or *cost* of the alternatives 216
6.3 Storage, updating and recalculation of the routing table and routing database 218
6.4 The accuracy and stability of routing tables 219
6.5 Representation of destinations in a routing table 222
6.6 Routing protocols and their associated algorithms and metrics 223
6.7 Distributing routing information around an internetwork 223
6.8 Distance vector and link state protocol routing methodologies 227
6.9 Initiating router protocols: neighbour discovery and the hello procedure 229
6.10 Routing protocols and their relationship with the Internet protocol (IP) 229
6.11 The different internetwork routing protocols — when to use them 230
6.12 RIP (routing information protocol) 232
6.13 OSPF (open shortest path first) 237
6.14 BGP4 (border gateway protocol version 4) 259

6.15 Problems associated with routing in source and destination local networks 266
6.16 Routing management issues 274

7 Transport Services and Protocols 277
7.1 Transport services and end-to-end communication between hosts 277
7.2 User datagram protocol (UDP) 282
7.3 Transmission control protocol (TCP) 283
7.4 Resource reservation protocol (RSVP) 299
7.5 MPLS (multiprotocol label switching) 305

8 IP Networks in Practice: Components, Backbone and Access 317
8.1 The components and hierarchy of an IP-based data network 317
8.2 The Internet, intranets, extranets and VPN 320
8.3 Network technologies typically used in IP-backbone networks 323
8.4 Access network technologies 332
8.5 Link establishment and control 338
8.6 Wireless technologies for Internet access 350
8.7 Host functionality and software for communication via IP 354

9 Managing the Network 357
9.1 Managing and configuring via the console port 357
9.2 Basic network management: alarms, commands, polling, events and traps 359
9.3 Management information base (MIB) and managed objects (MOs) 361
9.4 Structure of management information (SMIv1 and SMIv2) 364
9.5 Management information base-2 (mib-2 or MIB-II) 365
9.6 Remote network monitoring (RMON) 366
9.7 MIB for Internet protocol version 6 (ipv6MIB) 369
9.8 Simple network management protocol (SNMP) 376
9.9 The ISO management model: FCAPS, TMN, and CMIP/CMISE 393
9.10 Tools for network management 397

10 Data Networking and Internet Applications 407
10.1 Computer applications and data networks: application layer protocols 407
10.2 Telnet 411
10.3 FTP (file transfer protocol) 416
10.4 TFTP (trivial file transfer protocol) 425
10.5 Secure shell program and protocol (SSH or SECSH) 428
10.6 RTP/RTPC: real time signal carriage over IP networks 444
10.7 Applications, protocols and real networks 448
10.8 Other network/application protocols of note 450

11 The Worldwide Web (www) 453
11.1 The emergence of the Worldwide Web (www) 453
11.2 Domain name system (DNS) 454
11.3 Internet cache protocol (ICP) 464
11.4 WINS; Windows2000 ADS; Novell NDS 464
11.5 Hypertext transfer protocol (http) 465
11.6 Hypertext markup language (html) 476
11.7 Web browsers 479
11.8 Web-based applications 480

12 Electronic Mail (email) 483
12.1 A typical electronic mail 483
12.2 The benefits of electronic mail (email) 484
12.3 The principles of the Internet mail transfer system (MTS) 485
12.4 Operation of the Internet mail system 487
12.5 The Internet message format 489
12.6 Simple mail transfer protocol (SMTP) 494
12.7 Internet mail access protocol (IMAP4) 499
12.8 The post office protocol version 3 (POP3) 503

13 Data Network Security 507
13.1 The trade-off between confidentiality and interconnectivity 507
13.2 Data network protection: the main types of threat and counter-measure 508
13.3 Destination access control methods 512
13.4 Firewalls 516
13.5 Path protection 524
13.6 Network entry or access control 541
13.7 Encryption 550
13.8 Application layer interface for security protocols 560
13.9 Other risks and threats to data security and reliable network operations 560

14 Quality of Service (QOS), Network Performance and Optimisation 565
14.1 Framework for network performance management 565
14.2 Quality of service (QOS) and network performance (NP) 566
14.3 Quality of service (QOS), type of service (TOS) and class of service (COS) 569
14.4 Data network traffic theory: dimensioning data networks 575
14.5 Application design factors affecting quality of service 585
14.6 Network design for efficient, reliable and robust networks 586
14.7 Network operations and performance monitoring 595
14.8 Network management, back-up and restoration 596
14.9 Performance optimisation in practice 606

15 Challenges Ahead for IP 611
15.1 Financing the network 611
15.2 Network architecture, interconnection and peering 612
15.3 Quality of service (QOS) and network performance (NP) 612
15.4 Scaling and adapting the network for higher speeds and real-time applications 612
15.5 Network management 613

Appendix 1 Protocol Addresses, Port Numbers, Service Access Point Identifiers (SAPIs) and Common Presentation Formats 615

Appendix 2 Internet Top-Level Domains (TLDs) and Generic Domains 633

Appendix 3 Internet Country Code Top-Level Domains (ccTLDs — ISO 3166-1) 635

Appendix 4 Internet Engineering Task Force (IETF) Request for Comment (RFC) Listing 639

Appendix 5 IEEE 802 Standards for LANs and MANs 657

Appendix 6 IEEE 802.11: Wireless Local Area Networks (WLANs) 661

Appendix 7 Interfaces, Cables, Connectors and Pin-outs 667

Appendix 8 X.25 Packet Switching (ITU-T Recommendation X.25) 685

Appendix 9 Frame Relay 691

Appendix 10 Asynchronous Transfer Mode (ATM) 699

Glossary of Selected Terms 717

Abbreviations and Standards Quick-Reference 737
