Part I Modelling and Model Building **5**

1 Modelling and Model Building 7
Mark Mulligan and John Wainwright

1.1 The role of modelling in environmental research 7
1.1.1 The nature of research 7
1.1.2 A model for environmental research 7
1.1.3 The nature of modelling 8
1.1.4 Researching environmental systems 8
1.2 Models with a purpose (the purpose of modelling) 10
1.2.1 Models with a poorly defined purpose 12
1.3 Types of model 13
1.4 Model structure and formulation 15
1.4.1 Systems 15
1.4.2 Assumptions 15
1.4.3 Setting the boundaries 16
1.4.4 Conceptualizing the system 17
1.4.5 Model building 17
1.4.6 Modelling in graphical model-building tools: using SIMILE 18
1.4.7 Modelling in spreadsheets: using Excel 20
1.4.8 Modelling in high-level modelling languages: using PCRASTER 22
1.4.9 Hints and warnings for model building 28

1.5 Development of numerical algorithms 29
1.5.1 Defining algorithms 29
1.5.2 Formalizing environmental systems 29
1.5.3 Analytical models 34
1.5.4 Algorithm appropriateness 35
1.5.5 Simple iterative methods 38
1.5.6 More versatile solution techniques 40
1.6 Model parameterization, calibration and validation 51
1.6.1 Chickens, eggs, models and parameters? 51
1.6.2 Defining the sampling strategy 52
1.6.3 What happens when the parameters don't work? 54
1.6.4 Calibration and its limitations 54
1.6.5 Testing models 55
1.6.6 Measurements of model goodness-of-fit 56
1.7 Sensitivity analysis and its role 58
1.8 Errors and uncertainty 59
1.8.1 Error 59
1.8.2 Reporting error 66
1.8.3 From error to uncertainty 66
1.8.4 Coming to terms with error 67
1.9 Conclusion 67
References 68

Part II The State of the Art in Environmental Modelling 75

2 Climate and Climate-System Modelling 77
L.D. Danny Harvey

2.1 The complexity 77
2.2 Finding the simplicity 79
2.2.1 Models of the atmosphere and oceans 79
2.2.2 Models of the carbon cycle 81
2.2.3 Models of atmospheric chemistry and aerosols 83
2.2.4 Models of ice sheets 84
2.2.5 The roles of simple and complex climate-system models 84
2.3 The research frontier 85
2.4 Case study 86
References 89

3 Soil and Hillslope Hydrology 93
Andrew Baird

3.1 It's downhill from here 93
3.2 Easy does it: the laboratory slope 93
3.2.1 Plane simple: overland flow on Hillslope 1 93
3.2.2 Getting a head: soil-water/ground-water flow in Hillslope 2 95
3.3 Variety is the spice of life: are real slopes too hot to handle? 97
3.3.1 Little or large?: Complexity and scale 97
3.3.2 A fitting end: the physical veracity of models 99
3.3.3 Perceptual models and reality: 'Of course, it's those bloody macropores again!' 100

3.4 Eenie, meenie, minie, mo: choosing models and identifying processes 102
Acknowledgements 103
References 103

4 Modelling Catchment Hydrology 107
Mark Mulligan

4.1 Introduction: connectance in hydrology 107
4.2 The complexity 108
4.2.1 What are catchments? 108
4.2.2 Representing the flow of water in landscapes 108
4.2.3 The hydrologically significant properties of catchments 113
4.2.4 A brief review of catchment hydrological modelling 113
4.2.5 Physically based models 114
4.2.6 Conceptual and empirical models 115
4.2.7 Recent developments 116
4.3 The simplicity 117
4.3.1 Simplifying spatial complexity 117
4.3.2 Simplifying temporal complexity 117
4.3.3 Simplifying process complexity 117
4.3.4 Concluding remarks 118
References 119

5 Modelling Fluvial Processes and Interactions 123
Katerina Michaelides and John Wainwright

5.1 Introduction 123
5.2 The complexity 123
5.2.1 Form and process complexity 123
5.2.2 System complexity 126
5.3 Finding the simplicity 126
5.3.1 Mathematical approaches 127
5.3.2 Numerical modelling of fluvial interactions 129
5.3.3 Physical modelling of fluvial processes and interactions 131
5.4 Case study 1: modelling an extreme storm event 135
5.5 Case study 2: holistic modelling of the fluvial system 136
5.6 The research frontier 138
Acknowledgements 138
References 138

6 Modelling the Ecology of Plants 143
Colin P. Osborne

6.1 The complexity 143
6.2 Finding the simplicity 144
6.2.1 A question of scale 144
6.2.2 What are the alternatives for modelling plant function? 145
6.2.3 Applying a mechanistic approach 146
6.3 The research frontier 148
6.4 Case study 148
6.5 Conclusion 152
Acknowledgements 152
References 152

7 Spatial Population Models for Animals 157
George L.W. Perry and Nick R. Bond

7.1 The complexity: introduction 157
7.2 Finding the simplicity: thoughts on modelling spatial ecological systems 158
7.2.1 Space, spatial heterogeneity and ecology 158
7.2.2 Three approaches to spatially explicit ecological modelling 158
7.2.3 Top-down or bottom-up? 162
7.3 The research frontier: marrying theory and practice 162
7.4 Case study: dispersal dynamics in stream ecosystems 163
7.4.1 The problem 163
7.4.2 The model 164
7.4.3 The question 164
7.4.4 Results 165
7.5 Conclusion 165
Acknowledgements 167
References 167

8 Ecosystem Modelling: Vegetation and Disturbance 171
Stefano Mazzoleni, Francisco Rego, Francesco Giannino and Colin Legg

8.1 The system complexity: effects of disturbance on vegetation dynamics 171
8.1.1 Fire 171
8.1.2 Grazing 172
8.1.3 Fire and grazing interactions 172
8.2 Model simplification: simulation of plant growth under grazing and after fire 173
8.3 New developments in ecosystem modelling 176
8.4 Interactions of fire and grazing on plant competition: field experiment and modelling applications 177
8.4.1 A case study 177
8.4.2 A model exercise 177
8.5 Conclusion 183
Acknowledgements 183
References 183

9 Erosion and Sediment Transport 187
John N. Quinton

9.1 The complexity 187
9.2 Finding the simplicity 189
9.2.1 Parameter uncertainty 189
9.2.2 What are the natural levels of uncertainty? 190
9.2.3 Do simple models predict erosion any better than more complex ones? 190
9.3 Finding simplicity 191
9.4 The research frontier 192
9.5 Case study 192
Note 195
References 195

10 Modelling Slope Instability 197
Andrew Collison and James Griffiths

10.1 The complexity 197

10.2 Finding the simplicity 198
10.2.1 One-dimensional models 198
10.2.2 Two-dimensional models 199
10.2.3 Three-dimensional models 200
10.2.4 Slope instability by flow 201
10.2.5 Modelling external triggers 201
10.2.6 Earthquakes 202
10.3 The research frontier 202
10.4 Case study 203
10.4.1 The problem 203
10.4.2 The modelling approach 203
10.4.3 Validation 204
10.4.4 Results 205
10.5 Conclusion 207
References 207

11 Finding Simplicity in Complexity in Biogeochemical Modelling 211
Hördur V. Haraldsson and Harald U. Sverdrup

11.1 Introduction to models 211
11.2 Dare to simplify 212
11.3 Sorting 214
11.4 The basic path 216
11.5 The process 216
11.6 Biogeochemical models 217
11.7 Conclusion 221
References 222

12 Modelling Human Decision-Making 225
John Wainwright and Mark Mulligan

12.1 Introduction 225
12.2 The human mind 226
12.3 Modelling populations 228
12.4 Modelling decisions 229
12.4.1 Agent-based modelling 229
12.4.2 Economics models 234
12.4.3 Game theory 235
12.4.4 Scenario-based approaches 237
12.4.5 Integrated analysis 239
12.5 Never mind the quantities, feel the breadth 239
12.6 Perspectives 241
References 242

13 Modelling Land-Use Change 245
Eric F. Lambin

13.1 The complexity 245
13.1.1 The nature of land-use change 245
13.1.2 Causes of land-use changes 245
13.2 Finding the simplicity 246
13.2.1 Empirical-statistical models 246

13.2.2 Stochastic models 247
13.2.3 Optimization models 247
13.2.4 Dynamic (process-based) simulation models 248
13.3 The research frontier 249
13.3.1 Addressing the scale issue 250
13.3.2 Modelling land-use intensification 250
13.3.3 Integrating temporal heterogeneity 250
13.4 Case study 251
13.4.1 The problem 251
13.4.2 Model structure 251
References 253

Part III Models for Management **255**

14 Models in Policy Formulation and Assessment: The WadBOS Decision-Support System 257
Guy Engelen

14.1 Introduction 257
14.2 Functions of WadBOS 258
14.3 Decision-support systems 258
14.4 Building the integrated model 259
14.4.1 Knowledge acquisition and systems analysis 259
14.4.2 Modelling and integration of models 260
14.4.3 Technical integration 261
14.5 The integrated WadBOS model 262
14.5.1 The economic submodel 262
14.5.2 Landscape 264
14.5.3 The ecological subsystem 265
14.6 The toolbase 266
14.7 The database 267
14.8 The user interface 268
14.9 Conclusion 269
Acknowledgements 270
References 271

15 Decision-Support Systems for Managing Water Resources 273
Sophia Burke

15.1 Introduction 273
15.2 Why are DSS needed? 273
15.3 Design of a decision-support system 274
15.4 Conclusion 276
15.5 DSS on the web 276
References 276

16 Soil Erosion and Conservation 277
Mark A. Nearing

16.1 The problem 277
16.2 The approaches 279
16.3 The contributions of modelling 281
16.3.1 Potential changes in rainfall erosivity in the USA during the twenty-first century 282

16.3.2 Effects of precipitation intensity changes versus number of days of rainfall 284
16.4 Lessons and implications 287
Acknowledgements 288
Note 288
References 288

17 Modelling in Forest Management 291
Mark J. Twery

17.1 The issue 291
17.2 The approaches 292
17.2.1 The empirical approach 292
17.2.2 The mechanistic approach 292
17.2.3 The knowledge-based approach 292
17.3 The contribution of modelling 293
17.3.1 Models of the forest system 293
17.3.2 Models of human responses and interactions 294
17.3.3 Integrating techniques 295
17.4 Lessons and implications 297
17.4.1 Models can be useful 297
17.4.2 Goals matter 297
17.4.3 People need to understand trade-offs 297
Note 298
References 298

18 Stability and Instability in the Management of Mediterranean Desertification 303
John B. Thornes

18.1 Introduction 303
18.2 Basic propositions 304
18.3 Complex interactions 306
18.3.1 Spatial variability 309
18.3.2 Temporal variability 310
18.4 Climate gradient and climate change 311
18.5 Implications 313
18.6 Plants 313
18.7 Conclusion 314
References 314

Part IV Current and Future Developments **317**

19 Scaling Issues in Environmental Modelling 319
Xiaoyang Zhang, Nick A. Drake and John Wainwright

19.1 Introduction 319
19.2 Scale and scaling 320
19.2.1 Meanings of scale in environmental modelling 320
19.2.2 Scaling 320
19.3 Causes of scaling problems 322
19.4 Scaling issues of input parameters and possible solutions 322
19.4.1 Change of parameters with scale 322
19.4.2 Methods of scaling parameters 323

19.5 Methodology for scaling physically based models 324
19.5.1 Incompatibilities between scales 324
19.5.2 Methods for upscaling environmental models 325
19.5.3 Approaches for downscaling climate models 328
19.6 Scaling land-surface parameters for a soil-erosion model: a case study 328
19.6.1 Sensitivity of both topographic slope and vegetation cover to erosion 328
19.6.2 A fractal method for scaling topographic slope 329
19.6.3 A frequency-distribution function for scaling vegetation cover 329
19.6.4 Upscaled soil-erosion models 329
19.7 Conclusion 332
References 332

20 Environmental Applications of Computational Fluid Dynamics 335
Nigel G. Wright and Christopher J. Baker

20.1 Introduction 335
20.2 CFD fundamentals 335
20.2.1 Overview 335
20.2.2 Equations of motion 336
20.2.3 Grid structure 336
20.2.4 Discretization and solution methods 338
20.2.5 The turbulence-closure problem and turbulence models 338
20.2.6 Boundary conditions 339
20.2.7 Post-processing 339
20.2.8 Validation and verification 339
20.3 Applications of CFD in environmental modelling 339
20.3.1 Hydraulic applications 339
20.3.2 Atmospheric applications 342
20.4 Conclusion 345
References 347

21 Self-Organization and Cellular Automata Models 349
David Favis-Mortlock

21.1 Introduction 349
21.1.1 The ever-decreasing simplicity of models? 349
21.2 Self-organization in complex systems 351
21.2.1 Deterministic chaos and fractals 351
21.2.2 Early work on self-organizing systems 352
21.2.3 Attributes of self-organizing systems 352
21.2.4 The counter-intuitive universality of self-organization 354
21.3 Cellular automaton models 355
21.3.1 Self-organization on a cellular grid 356
21.3.2 Kinds of CA models 356
21.3.3 Computational constraints to CA modelling 356
21.3.4 Modelling self-organization: the problem of context and boundaries 356
21.3.5 Terminology: self-organization and cellular automata 357
21.3.6 Geomorphological applications of CA models 357
21.4 Case study: modelling rill initiation and growth 358
21.4.1 The RillGrow 1 model 358
21.4.2 The RillGrow 2 model 359

21.5 Conclusion 363
Acknowledgements 365
Notes 366
References 367

22 Data-Based Mechanistic Modelling and the Simplification of Environmental Systems 371
Peter C. Young, Arun Chotai and Keith J. Beven

22.1 Introduction 371
22.2 Philosophies of modelling 372
22.3 Statistical identification, estimation and validation 373
22.3.1 Structure and order identification 373
22.3.2 Estimation (optimization) 373
22.3.3 Conditional validation 373
22.4 Data-based mechanistic (DBM) modelling 374
22.5 The statistical tools of DBM modelling 376
22.6 Practical examples 376
22.6.1 A linear example: modelling solute transport 376
22.6.2 A nonlinear example: rainfall-flow modelling 380
22.7 The evaluation of large deterministic simulation models 383
22.8 Conclusion 385
Notes 386
References 386

23 Pointers for the Future 389
John Wainwright and Mark Mulligan

23.1 What have we learned? 389
23.1.1 Explanation 389
23.1.2 Qualitative issues 391
23.1.3 Reductionism, holism and self-organized systems 392
23.1.4 How should we model? 392
23.1.5 Modelling methodology 393
23.1.6 Process 393
23.1.7 Modelling in an integrated methodology 393
23.1.8 Data issues 394
23.1.9 Modelling and policy 395
23.1.10 What is modelling for? 395
23.1.11 Moral and ethical questions 395
23.2 Research directions 395
23.3 Is it possible to find simplicity in complexity? 396
References 396
