

Second edition

Pneumatic Conveying Design Guide

A close-up photograph of a pneumatic conveying system. The image shows several white, cylindrical pipes of varying diameters and orientations. A yellow chain is draped across the pipes, and a black cable is also visible. The background is a complex network of similar pipes, creating a sense of depth and industrial complexity.

David Mills

Contents

Preface	xi
Part A: Systems and Components	
1. Introduction to pneumatic conveying and the guide	03
1.1 Introduction	03
1.2 Pneumatic conveying	03
1.3 Information provided	13
1.4 Review of chapters	14
1.5 Definitions	20
1.6 Nomenclature	25
References	28
2. Review of pneumatic conveying systems	29
2.1 Introduction	29
2.2 System types	29
2.3 System requirements	48
2.4 Material property influences	50
References	53
3. Pipeline feeding devices – Part I: Low pressure and vacuum	54
3.1 Introduction	54
3.2 Rotary valves	58
3.3 Screw feeders	68
3.4 Venturi feeders	69
3.5 Gate lock valves	71
3.6 Suction nozzles	73
3.7 Trickle valves	76
3.8 Blow tanks	77
References	79
4. Pipeline feeding devices – Part II: High pressure	80
4.1 Introduction	80
4.2 Screw feeders	81
4.3 Rotary valves	82
4.4 Blow tanks	82
4.5 Lock hoppers	101
References	103
5. Pipelines and valves	104
5.1 Introduction	104
5.2 Pipelines	104

5.3	Valves	110
5.4	Rubber hose	114
	References	116
6.	Air movers	117
6.1	Introduction	117
6.2	Types of air mover	117
6.3	Air compression effects	130
6.4	Pre-cooling systems	137
6.5	Nomenclature	137
	References	138
7.	Gas–solid separation devices	139
7.1	Introduction	139
7.2	Dust control	140
7.3	Separation devices	141
7.4	System considerations	150
	References	151
8.	System selection considerations	152
8.1	Introduction	152
8.2	Variables involved	153
8.3	Variables investigated	155
8.4	Material compatibility	164
8.5	Design curves	164
8.6	Power requirements	172
8.7	System selection considerations	177
Part B: System Design		
9.	Air flow rate evaluation	183
9.1	Introduction	183
9.2	Volumetric flow rate	186
9.3	The influence of pressure	190
9.4	Stepped pipeline systems	196
9.5	Pipeline purging	202
9.6	The influence of temperature	203
9.7	The influence of altitude	208
9.8	The use of air mass flow rate	209
9.9	Nomenclature	210
10.	Air only relationships	211
10.1	Introduction	211
10.2	Pipeline pressure drop	211
10.3	Venturi analysis	224

10.4	Air flow rate control	227
10.5	Stepped pipelines	232
10.6	Nomenclature	234
	References	235
11.	Conveying characteristics	236
11.1	Introduction	236
11.2	Single phase flow	237
11.3	Gas–solid flows	239
11.4	The determination of conveying characteristics	243
11.5	Energy considerations	247
11.6	Component pressure drop relationships	252
11.7	Nomenclature	257
	References	257
12.	Conveying capability	258
12.1	Introduction	258
12.2	The influence of materials	258
12.3	System capability	283
	References	286
13.	Material property influences	287
13.1	Introduction	287
13.2	Conveying modes	287
13.3	Conveying capability correlations	294
13.4	Material grade influences	305
13.5	Material degradation effects	311
	References	318
14.	Pipeline scaling parameters	319
14.1	Introduction	319
14.2	Scaling requirements	319
14.3	Conveying distance	320
14.4	Pipeline bore	327
14.5	Pipeline bends	333
14.6	Vertical pipelines	342
14.7	Pipeline material	346
14.8	Stepped pipelines	349
	References	353
15.	Design procedures	355
15.1	Introduction	355
15.2	The use of equations in system design	355
15.3	The use of test data in system design	367
15.4	Typical pipeline and material influences	372

16. Case studies – Part I: Fine material	384
16.1 Introduction	384
16.2 Conveying data	385
16.3 Procedure	388
17. Case studies – Part II: Coarse material	395
17.1 Introduction	395
17.2 Conveying data	395
17.3 Procedure	398
18. First approximation design methods	404
18.1 Introduction	404
18.2 Air only pressure drop method	405
18.3 Universal conveying characteristics method	413
19. Multiple use systems	423
19.1 Introduction	423
19.2 Multiple material handling	424
19.3 Multiple delivery points	426
19.4 The use of stepped pipelines	428
References	435
Part C: System Operation	
20. Troubleshooting and material flow problems	439
20.1 Introduction	439
20.2 Pipeline blockage	439
21. Optimizing and up-rating of existing systems	461
21.1 Introduction	461
21.2 System not capable of duty	463
21.3 Optimizing existing systems	464
21.4 Case study	467
21.5 Alternative methods of up-rating	474
22. Operating problems	478
22.1 Introduction	478
22.2 Types of system	479
22.3 System components	482
22.4 System related	491
22.5 Material related	494
References	497
23. Erosive wear	498
23.1 Introduction	498
23.2 Influence of variables	499
23.3 Industrial solutions and practical issues	512
References	524

24. Particle degradation	526
24.1 Introduction	526
24.2 Influence of variables	530
24.3 Recommendations and practical issues	538
24.4 Pneumatic conveying data	540
24.5 Particle melting	544
References	546
25. Moisture and condensation	547
25.1 Introduction	547
25.2 Humidity	547
25.3 Air processes	554
25.4 Energy considerations	564
25.5 Nomenclature	569
26. Health and safety	570
26.1 Introduction	570
26.2 Dust risks	571
26.3 Conveying systems	578
26.4 System components	580
26.5 Conveying operations	583
26.6 Explosion protection	587
References	594
Appendix 1: Determination of relevant material properties	595
A1.1 Introduction	595
A1.2 Particle size and shape	596
A1.3 Particle and bulk density	602
A1.4 Flow properties	605
A1.5 Aeration properties	608
References	616
Appendix 2: Additional conveying data	617
A2.1 Introduction	617
A2.2 Materials and pipelines listings	617
A2.3 Material properties listings	620
A2.4 Additional conveying data	622
Index	629
