Preface

xiii

1	Introduction	1
1.1	Background	1
1.2	Flexible Alternating Current Transmission Systems	2
1.3	Inherent Limitations of Transmission Systems	3
1.4	FACTS Controllers	3
1.5	Steady-state Power System Analysis	6
	References	6
2	Modelling of FACTS Controllers	9
2.1	Introduction	9
2.2	Modelling Philosophy	11
2.3	Controllers Based on Conventional Thyristors	11
2.3.1	The Thyristor-controlled Reactor	12
2.3.2	The Static VAR Compensator	16
2.3.3	The Thyristor-controlled Series Compensator	18
2.3.3.1	Thyristor-controlled Series Capacitor Equivalent Circuit	19
2.3.3.2	Steady-state Current and Voltage Equations	20
2.3.3.3	Thyristor-controlled Series Capacitor Fundamental Frequency Impedance	24
2.4	Power Electronic Controllers Based on Fully Controlled Semiconductor Devices	28
2.4.1	The Voltage Source Converter	29
2.4.1.1	Pulse-width Modulation Control	30
2.4.1.2	Principles of Voltage Source Converter Operation	33
2.4.2	The Static Compensator	34
2.4.3	The Solid State Series Compensator	35
2.4.4	The Unified Power Flow Controller	36
2.4.5	The High-voltage Direct-current Based on Voltage Source Converters	38
2.5	Control Capabilities of Controllers Based on Voltage Source Converters	40
2.6	Summary	41
	References	41
3	Modelling of Conventional Power Plant	43
3.1	Introduction	43
3.2	Transmission Line Modelling	44
3.2.1	The Voltage-drop Equation	45
3.2.1.1	Calculation of Lumped RLC Parameters	45
3.2.1.2	Shunt Admittances	47
3.2.1.3	Internal Impedances	47
3.2.1.4	Ground Return Impedances	48
3.2.2	Ground Wires	50
3.2.3	Bundle Conductors	51

3.2.4	Double Circuit Transmission Lines	54
3.2.5	The Per-unit System	55
3.2.6	Transmission-line Program: Basic Parameters	56
3.2.7	Numerical Example of Transmission Line Parameter Calculation	59
3.2.8	Long Line Effects	60
3.2.9	Transmission Line Transpositions	62
3.2.10	Transmission Line Program: Distributed Parameters	63
3.2.11	Numerical Example of Long Line Parameter Calculation	66
3.2.12	Symmetrical Components and Sequence Domain Parameters	67
3.2.13	Transmission Line Program: Sequence Parameters	69
3.2.14	Numerical Example of Sequence Parameter Calculation	69
3.3	Power Transformer Modelling	70
3.3.1	Single-phase Transformers	70
3.3.2	Simple Tap-changing Transformer	72
3.3.3	Advanced Tap-changing Transformer	73
3.3.4	Three-phase Transformers	75
3.3.4.1	Star–Star Connection	76
3.3.4.2	Delta–Delta Connection	78
3.3.4.3	Star–Delta Connection	78
3.3.5	Sequence Domain Parameters	79
3.4	Rotating Machinery Modelling	82
3.4.1	Machine Voltage Equation	83
3.5	System Load	86
3.6	Summary	89
	References	90
4	Conventional Power Flow	93
4.1	Introduction	93
4.2	General Power Flow Concepts	93
4.2.1	Basic Formulation	94
4.2.2	Variables and Bus Classification	97
4.3	Power Flow Solution Methods	97
4.3.1	Early Power Flow Algorithms	97
4.3.2	The Newton–Raphson Algorithm	98
4.3.3	State Variable Initialisation	101
4.3.4	Generator Reactive Power Limits	101
4.3.5	Linearised Frame of Reference	102
4.3.6	Newton–Raphson Computer Program in Matlab® Code	104
4.3.7	The Fast Decoupled Algorithm	111
4.3.8	Fast Decoupled Computer Program in Matlab® Code	112
4.3.9	A Benchmark Numerical Example	115
4.4	Constrained Power Flow Solutions	119
4.4.1	Load Tap-changing Transformers	119
4.4.1.1	State Variable Initialisation and Limit Checking	121
4.4.1.2	Load Tap Changer Computer Program in Matlab® Code	122
4.4.1.3	Test Case of Voltage Magnitude Control with Load Tap-changing	127
4.4.1.4	Combined Voltage Magnitude Control by Means of Generators and Load Tap Changers	130
4.4.1.5	Control Coordination between One Load Tap Changer and One Generator	130
4.4.2	Phase-shifting Transformer	132
4.4.2.1	State Variable Initialisation and Limit Checking	134
4.4.2.2	Phase-shifter Computer Program in Matlab® Code	135
4.4.2.3	Test Cases for Phase-shifting Transformers	140

4.5	Further Concepts in Power Flows	144
4.5.1	Sparsity-oriented Solutions	144
4.5.2	Truncated Adjustments	145
4.5.2.1	Test Case of Truncated Adjustments Involving Three Load Tap-changing Transformers	145
4.5.3	Special Load Tap Changer Configurations	147
4.5.3.1	Test Case of Sensitivity Factors in Parallel Load Tap-changing Operation	148
4.6	Summary	149
	References	150
5	Power Flow Including FACTS Controllers	153
5.1	Introduction	153
5.2	Power Flow Solutions Including FACTS Controllers	154
5.3	Static VAR Compensator	155
5.3.1	Conventional Power Flow Models	155
5.3.2	Shunt Variable Susceptance Model	158
5.3.3	Static VAR Compensator Computer Program in Matlab® Code	159
5.3.4	Firing-angle Model	162
5.3.5	Static VAR Compensator Firing-angle Computer Program in Matlab® Code	162
5.3.6	Integrated Transformer Firing-angle Model	166
5.3.7	Nodal Voltage Magnitude Control using Static VAR Compensators	167
5.3.8	Control Coordination between Reactive Sources	168
5.3.9	Numerical Example of Voltage Magnitude Control using One Static VAR Compensator	168
5.4	Thyristor-controlled Series Compensator	171
5.4.1	Variable Series Impedance Power Flow Model	171
5.4.2	Thyristor-controlled Series Compensator Computer Program in Matlab® Code	173
5.4.3	Numerical Example of Active Power Flow Control using One Thyristor-controlled Series Compensator: Variable Series Compensator Model	178
5.4.4	Firing-angle Power Flow Model	180
5.4.5	Thyristor-controlled Series Compensator Firing-angle Computer Program in Matlab® Code	182
5.4.6	Numerical Example of Active Power Flow Control using One Thyristor-controlled Series Compensator: Firing-angle Model	187
5.4.7	Numerical Properties of the Thyristor-controlled Series Compensator Power Flow Model	189
5.5	Static Synchronous Compensator	191
5.5.1	Power Flow Model	191
5.5.2	Static Compensator Computer Program in Matlab® Code	192
5.5.3	Numerical Example of Voltage Magnitude Control using One Static Compensator	198
5.6	Unified Power Flow Controller	200
5.6.1	Power Flow Model	201
5.6.2	Unified Power Flow Controller Computer Program in Matlab® Code	203
5.6.3	Numerical Example of Power Flow Control using One Unified Power Flow Controller	213
5.7	High-voltage Direct-current-based Voltage Source Converter	216
5.7.1	Power Equations	217
5.7.2	High-voltage Direct-current-based Voltage Source Converter Computer Program in Matlab® Code	218
5.7.3	Numerical Example of Power Flow Control using One HVDC-VSC	225

5.7.3.1	HVDC-VSC Back-to-back Model	225
5.7.3.2	HVDC-VSC Full Model	225
5.8	Effective Initialisation of FACTS Controllers	227
5.8.1	Controllers Represented by Shunt Synchronous Voltage Sources	227
5.8.2	Controllers Represented by Shunt Admittances	227
5.8.3	Controllers Represented by Series Reactances	227
5.8.4	Controllers Represented by Series Synchronous Voltage Sources	228
5.9	Summary	228
	References	229
6	Three-phase Power Flow	231
6.1	Introduction	231
6.2	Power Flow in the Phase Frame of Reference	232
6.2.1	Power Flow Equations	233
6.2.2	Newton-Raphson Power Flow Algorithm	234
6.2.3	Matlab [®] Code of a Power Flow Program in the Phase Frame of Reference	236
6.2.4	Numerical Example of a Three-phase Network	244
6.3	Static VAR Compensator	249
6.3.1	Variable Susceptance Model	250
6.3.2	Firing-angle Model	251
6.3.3	Numerical Example: Static VAR Compensator Voltage Magnitude Balancing Capability	252
6.4	Thyristor-controlled Series Compensator	253
6.4.1	Variable Susceptance Model	253
6.4.2	Firing-angle Model	255
6.4.3	Numerical Example: Power Flow Control using One Thyristor-controlled Series Compensator	257
6.5	Static Compensator	257
6.5.1	Static Compensator Three-phase Numerical Example	260
6.6	Unified Power Flow Controller	261
6.6.1	Numerical Example of Power Flow Control using One Unified Power Flow Controller	264
6.7	Summary	264
	References	265
7	Optimal Power Flow	267
7.1	Introduction	267
7.2	Optimal Power Flow using Newton's Method	268
7.2.1	General Formulation	268
7.2.1.1	Variables	268
7.2.1.2	Objective Function	269
7.2.1.3	Equality Constraints	269
7.2.1.4	Inequality Constraints	270
7.2.2	Application of Newton's Method to Optimal Power Flow	270
7.2.3	Linearised System Equations	271
7.2.4	Optimality Conditions for Newton's Method	272
7.2.5	Conventional Power Plant Modelling in Optimal Power Flow	272
7.2.5.1	Transmission Lines	273
7.2.5.2	Shunt Elements	274
7.2.5.3	Synchronous Generators	275
7.2.6	Handling of Inequality Constraints	275
7.2.6.1	Handling of Inequality Constraints on Variables	275
7.2.6.2	Handling of Inequality Constraints on Functions	277

7.3	Implementation of Optimal Power Flow using Newton's Method	278
7.3.1	Initial Conditions in Optimal Power Flow Solutions	279
7.3.2	Active Power Schedule	279
7.3.3	Lagrange Multipliers	280
7.3.4	Penalty Weighting Factors	280
7.3.5	Conjugated Variables	280
7.3.6	An Optimal Power Flow Numerical Example	281
7.4	Power System Controller Representation in Optimal Power Flow Studies	283
7.5	Load Tap-changing Transformer	283
7.5.1	Load Tap-changing Lagrangian Function	283
7.5.2	Linearised System of Equations	284
7.5.3	Load Tap-changing Transformer Test Cases	285
7.6	Phase-shifting Transformer	286
7.6.1	Lagrangian Function	286
7.6.2	Linearised System of Equations	287
7.6.3	Phase-shifting Transformer Test Cases	289
7.6.3.1	Case 1: No Active Power Flow Regulation	289
7.6.3.2	Case 2: Active Power Flow Regulation at LakePS	290
7.7	Static VAR Compensator	291
7.7.1	Lagrangian Function	291
7.7.2	Linearised System of Equations	292
7.7.3	Static VAR Compensator Test Cases	293
7.7.3.1	Firing-angle Model	293
7.7.3.2	Susceptance Model	295
7.8	Thyristor-controlled Series Compensator	296
7.8.1	Lagrangian Function	296
7.8.2	Linearised System of Equations	297
7.8.3	Thyristor-controlled Series Compensator Test Cases	299
7.9	Unified Power Flow Controller	301
7.9.1	Unified Power Flow Controller Lagrangian Function	301
7.9.2	Direct-current Link Lagrangian Function	301
7.9.3	Unified Power Flow Controller Power Flow Constraints	302
7.9.4	Linearised System of Equations	302
7.9.5	Unified Power Flow Controller Test Cases	305
7.9.6	Unified Power Flow Controller Operating Modes	307
7.10	Summary	307
	References	308

8	Power Flow Tracing	311
8.1	Introduction	311
8.2	Basic Assumptions	312
8.3	Mathematical Justification of the Proportional Sharing Principle	313
8.4	Dominions	315
8.4.1	Dominion Contributions to Active Power Flows	317
8.4.2	Dominion Contributions to Reactive Power Flows	319
8.4.3	Dominion Contributions to Loads and Sinks	320
8.5	Tracing Algorithm	321
8.6	Numerical Examples	322
8.6.1	Simple Radial Network	322
8.6.2	Simple Meshed Network: Active Power	324
8.6.3	Meshed Network with FACTS Controllers: Reactive Power	329
8.6.4	Large Network	331
8.6.5	Tracing the Power Output of a Wind Generator	331
8.6.5.1	The Wind Generator Model	335
8.6.5.2	Numerical Example	336

8.7 Summary	339
References	340
Appendix A: Jacobian Elements for FACTS Controllers in Positive Sequence Power Flow	343
A.1 Tap-changing Transformer	343
A.2 Thyristor-controlled Series Compensator	344
A.3 Static Synchronous Compensator	345
A.4 Unified Power Flow Controller	345
A.5 High-voltage Direct-current-based Voltage Source Converter	347
Appendix B: Gradient and Hessian Elements for Optimal Power Flow Newton's Method	349
B.1 First and Second Partial Derivatives for Transmission Lines	349
B.1.1 The Gradient Vector	349
B.1.2 The Matrix W	350
B.2 Phase Shifter Transformer	352
B.3 Static VAR Compensator	355
B.4 Thyristor-controlled Series Compensator	356
B.5 Unified Power Flow Controller	357
