

Strength and Weathering of Rock as Boundary Layer Problems

Christine Butenuth

Imperial College Press

Acknowledgements	xi
Foreword	xvii
Preface	xix
Introduction	xxiii
1 Strength, in Particular Rock Strength: Concepts, Definitions and Experimental Techniques	1
1.1 Rock as a Mechanical Mixture of Phases: A Composite with History	1
1.2 Properties of Mechanical Mixtures: Composition and Construction	3
1.2.1 The Essential Distributions of Solid, Crystalline Particles in Space	31
1.2.2 Porosity and Its Determination as well as Some Remarks on Pore Shapes	36
1.2.3 Intergranular Materials (Cements)	45
1.2.4 Strength and Notch Systems at the Sample Surface	52
1.3 The Physical Definition of Strength: A General Measuring Instruction	57
1.3.1 Experimental Methods for the Determination of Strength of Rock	60
1.3.1.1 The Hoop Test	60
1.3.1.2 A Comparison of Tensile Strength Values of Rocks Determined by Point Load and Direct Tension Tests	70

1.4 Physico-Chemical Reactions, Suitable for a Selective Destruction of Rock Structure	80
1.4.1 Adsorption	83
1.4.2 The Formation of Changed Surface Structures During Weathering Reactions	84
2 Physico-Chemical Elements of the Strength of Pure Phases with Ionic Linkage	92
2.1 Force- and Energy-Distance Functions	96
2.1.1 Formation of Ion Pairs	96
2.1.2 Formation of Ion Chains	101
2.1.3 Force-elongation Curves for Uniform and Composed Chains	108
2.1.4 Estimate of the Theoretical Strength	117
2.1.5 Silicic Acid Chains	120
2.2 The Lattice Energy	124
2.3 Strength According to Orowan's and Griffith's Considerations	127
2.4 The Order of Magnitude of Thermal Surface Stresses for a Central Symmetric Phase Arrangement	133
2.5 Surface- and Interfacial-Energy	136
2.6 Overview of the Problems of Strength in Relation to Different Bondings in Materials	149
3 Strengthening of Grain Packings by Intermolecular Forces	165
3.1 Surface Tension of Liquid Water in Selected, Simple Systems	167
3.1.1 The Stresses Resulting from Wetting a Solid by a Liquid	170
3.1.2 Effect of Adhesion Tension in Selected, Simple Systems	171
3.2 Water Strengthened Grain Packings	174

4 The Behaviour of Sandstone Samples under Water; Weathering Processes	184
4.1 Definitions and Conventions	185
4.1.1 Sign Conventions for Forces	185
4.1.2 Swelling of Rocks	186
4.1.3 System and System Changes	186
4.2 Direct Observations and Photographic Registration of the Bunter Sandstone/Water System	189
4.2.1 Averaged Reaction Temperature and Weathering Regime on the Surface of the Earth	191
4.2.2 Results of Direct Observation by Photographic Registration	193
4.2.3 Inorganic-chemical Brutto Analysis (EDX) of the Mechanically Distinguishable Phases	198
4.2.4 Preliminary Remarks on the Morphology of the Suspended Phases	202
4.2.5 Substances and Products of Lateritic Weathering Set Free when Immersing Bunter Sandstone Samples in Water	207
4.2.6 Observations on Volume Changes of Bunter Sandstone Samples when Ageing in Water	210
4.2.7 Whereabouts of Pore Air	218
5 Conclusions from the Ageing Experiments of Bunter Sandstone in Water and the Distribution of Substances and Forces in Samples	220
5.1 Models for the Material and Pore Distribution in Bunter Sandstone	220
5.1.1 Experimental Pore Diameter Distribution Function	224
5.1.2 Diameters of Colloidal Sediments from Suspensions of Landslide Masses of Mürtenbach, Eifel (1989)	225
5.1.3 Diameters of the Colloidal Suspension Load of Rivers	227

5.1.4	Contact Bridges and Their Load Bearing Cross Section	228
5.1.5	Local and Time Dependent Influences, which Can Affect the Carrying Cross Section of Sandstone Samples	233
5.2	Summarising Remarks in View to the Results of the Ageing Experiments	244
