Contents

<i>Preface</i>	xi
1 Water and its roles in baked products	1
The composition and heat-related properties of water	1
Vapour pressure and relative humidity	3
Water hardness	7
Ionisation and solutions	8
The solubility of solids and their recrystallisation	10
Water of crystallisation	11
Vapour pressure of solutions	12
Osmotic pressure	13
Gases in solution	15
Suspensions	16
Colloidal suspensions	16
Hydration	17
Water as a plasticiser	18
Surface tension and capillary action	19
Gels and emulsions	20
Water in bakery ingredients	21
Conclusions	22
References	22
2 The role of water in the formation and processing of bread doughs	24
Wheat flour properties	24
The formation of bread doughs	25
Optimum dough water levels	30
Wheat flour water absorption capacity and its determination	33
Water levels in rye bread doughs	35
The effects of other dough ingredients on water levels in bread doughs	36
Dried gluten	36
Salt	36
Sugars	37
Enzymes	37
Other ingredients	37
Water in brews and sponges	38
Other factors affecting the level of water added to doughs	39
Dough and water temperatures	40

Water, dough rheology and moulding	43
Conclusions	46
References	46
3 The role of water in the formation and processing of batters, biscuit and cookie doughs, and pastes	48
The formation of cake batters	48
Dissolution and hydration of ingredients in cake batters	50
Water levels in cake batters	51
Flour properties and water levels in cake batters	54
Gases in cake batters	55
Wafer and other batters	56
Control of batter temperatures	57
Batter viscosity and its measurement	58
Formation and processing of biscuit and cookie doughs	59
Formation and processing of short pastry doughs	61
Formation and processing of laminated doughs	62
Biscuit dough and paste rheological properties	65
Compression–extrusion tests	65
Recording dough mixers	65
Load–extension tests	67
Fundamental tests	67
Choux pastries	68
Bakery products not based on flour	68
Baked products	68
Fillings	69
Toppings and icings	69
Marshmallow	69
Jams and jellies	69
Conclusions	70
References	70
4 The contribution of water during processing, baking, cooling and freezing	72
Water in retarded and frozen fermented, unbaked doughs	72
The influence of moisture on white spot formation during the retarding of fermented doughs	74
The importance of relative humidity during proof of fermented doughs	75
The contribution of water (steam) to expansion and product structure during baking	77
Bread and fermented products	79
Cakes	80
Laminated products	81
Biscuits and pastries	84
Choux pastry	84
Doughnuts	85

Wafers	85
Applications of steam during baking	85
Bread	86
Part-baked breads	86
Cakes	87
Choux pastry	87
Rye breads	87
Chinese steamed breads	88
Surface treatments with water and water-based solutions	88
Water and microwave baking	89
Losses of water during baking and cooling	90
Water in frozen bakery products	91
Conclusions	92
References	93
5 Effects of water on product textural properties and their changes during storage	95
The contribution of product moisture content to baked product character	95
Bread and fermented goods	95
Cakes	97
Pastries and laminated products	98
Biscuits and cookies	99
Loss of product freshness (staling)	99
Changes in bread character during storage	99
Changes in the character of cakes, biscuits and pastries	101
Checking in biscuits and crackers	102
Water and staling in bread	103
Cakes	105
Effects of freezing and thawing on product texture and eating quality	106
Unbaked bread doughs	106
Unbaked cake batters	108
Unbaked pastries	109
Bread	109
Shelling with frozen crusty breads and part-baked products	110
Cakes	110
Composite products	112
Conclusions	112
References	113
6 Water activity	115
Sources of moisture in bakery products	115
Product moisture content	117
The importance of water activity	117
The link between moisture content and water activity	118
Definitions of water activity and equilibrium relative humidity	120

Water activity and microbial spoilage	123
Water activity and the mould-free shelf-life of a product	126
Effects of packaging	128
Water activity and product rancidity	130
The influence of ingredients on water activity	130
Sucrose equivalence	132
Conclusions	133
References	134
7 Moisture migration and its control in composite products	135
Mechanisms of moisture migration	136
Diffusion	136
Vapour phase transfer	137
Syneresis	138
Fruited cakes and breads	138
Cream cakes	140
Sugar-based toppings	143
Savoury pastry products	145
Sweetened pastry products	147
Using stabilisers to control moisture migration	149
Moisture migration in composite biscuit products	149
The application of moisture barriers	150
Use of packaging materials	152
Moisture migration and product shelf-life	152
Method 1	154
Method 2	154
Method 3	154
Conclusions	155
References	155
8 Methods of determining moisture content and water availability	157
Determination of product moisture content and water activity	157
Measuring moisture content	158
Oven drying methods	159
Air oven drying	159
Vacuum oven drying	160
Electrical methods	161
Electronic moisture meters	161
Nuclear magnetic resonance	161
Near infrared	162
Infrared – direct heating	162
Advanced techniques for moisture measurement	163
Summary of instrument types used for moisture measurement	164
Methods for the calculation of moisture content	164
Methods for the measurement of water activity	166
Psychrometry	166

Indicator salts	166
Mechanical methods	167
Dew point	167
Electric and coulometric methods	168
Spectroscopic methods	168
Quartz crystal oscillation	168
Thermal conductivity gas analysis	169
Weight change method	169
Preparing samples for ERH measurement	170
Bread, rolls, plain cakes, biscuits and cookies	171
Swiss rolls	171
Fruit cakes and Christmas puddings	172
Filled products	172
Instrumental measurement of ERH	172
Methods of calculating water activity and ERH	174
Sucrose equivalence method	175
Determining sucrose equivalence data values	176
Calculating ERH using the sucrose equivalence method	177
Sucrose concentration method	179
Other methods for calculating water activity	180
Software to calculate water activity	181
ERH CALC™	181
Conclusions	185
References	186
9 Strategies for extending bakery product shelf-life	188
Manipulating water activity using ingredients	188
Storage temperature	189
Effects of pH	190
Extending product shelf-life by adjusting water content	190
Changing salt levels	192
Effects of sugars on cake shelf-life	193
Sucrose	193
Other sugars	194
Using humectants	196
Summary of the effects of recipe changes to cake shelf-life	197
Using preservatives	197
Flour confectionery products	198
Fermented products	199
Biscuit products	199
Reducing moisture migration	199
Extending shelf-life by other means	201
Ethanol surface spraying	201
Modified atmosphere packaging	201
Intelligent packaging	203
Packaging before baking	203
