Contributors	xi
Preface	xiii
1. Genetic Structure of Natural Plant and Pathogen Populations	1
<i>J.J. Burdon and P.H. Thrall</i>	
Introduction	1
Natural variation in host–pathogen associations	2
Disease resistance in plant populations in their native range	3
Variation in space: host–pathogen interactions as metapopulation associations	5
Host and pathogen variation in new environments	7
What is the resistance structure of invasive host populations?	7
How important is continuing natural selection for the maintenance of resistance in introduced populations?	9
How rapidly will resistance respond to the re-application of pathogen selective pressures?	11
Improving biological control strategies	12
How do host and pathogen life-history features and the environment interact to determine the genetic basis of resistance?	12
What are the selective consequences of rapid versus slower declines in population size?	13
Conclusions	14
Acknowledgement	15
References	15

2. Measuring Genetic Variation in Natural Enemies Used for Biological Control: Why and How?	19
<i>E. Wajnberg</i>	
Introduction	19
Why measure intrapopulation genetic variation in natural enemies?	20
Methods for measuring intrapopulation genetic variation	22
Parent-offspring regression	24
Sib analysis	24
Family analysis	24
Breeding selection	25
Intrapopulation genetic variation in insect parasitoids	26
What characters should be studied?	29
Conclusion	31
Acknowledgements	31
References	31
3. Molecular Systematics, Chalcidoidea and Biological Control	39
<i>J. Heraty</i>	
Introduction	39
Genes of interest	42
Genetic divergence	44
Identification	49
Phylogenetics and their applications	52
Relationships of Chalcidoidea	52
Relationships within Chalcidoidea	53
Eucharitidae: competing morphological and molecular trees	54
<i>Encarsia</i> : unchallenged trees and the interpretation of change	56
Phylogeography and invasive agents	59
Cospeciation	59
Conclusion	63
Acknowledgements	65
References	65
4. Genetic Markers in Rust Fungi and their Application to Weed Biocontrol	73
<i>K.J. Evans and D.R. Gomez</i>	
Introduction	73
Rust fungi as biocontrol agents of weeds	74
Genetic markers in rust fungi	75
Pathotyping	76
Selecting molecular markers for population-genetic studies	76
Relative utility of some common DNA markers	77
Emerging technologies	78
Application of molecular markers in weed biocontrol	78

Investigating relationships between weed diversity and pathogen variation	78
The skeleton rust story	79
The blackberry rust story	80
Identifying the released pathogen with certainty	83
The musk thistle rust story	83
Identifying and monitoring the fate of the released pathogen strain with certainty	84
Population genetics of rust fungi in relation to strain selection	85
Locating centres of diversity and evolutionary new associations	88
Conclusions	90
Acknowledgements	91
References	91
5. Tracing the Origin of Pests and Natural Enemies: Genetic and Statistical Approaches	97
<i>G.K. Roderick</i>	
Introduction	97
Problems and approaches	98
Patterns of spread	98
Invasion genetics	98
Types of genetic markers	103
Genealogies	104
Analysis of frequencies	106
Bioinformatics	107
Other methods	107
Discussion	107
Conclusions	108
Acknowledgements	109
References	109
6. Tracing the Origin of Cryptic Insect Pests and Vectors, and their Natural Enemies	113
<i>J.K. Brown</i>	
Introduction	113
Application of phylogeographical analysis of insect pests and vectors, and natural enemies	115
Genetic markers	116
Studies in which molecular markers have been employed for taxonomic identification and tracking of cryptic Hemipterans	118
Invasion of the B biotype <i>Bemisia tabaci</i> in the Americas and evidence for a species complex	118
Phylogeographical matching between <i>B. tabaci</i> mitochondria COI haplotypes and natural enemies from the same geographical origin	121

First demonstration that an invasive <i>B. tabaci</i> is associated with the spread of severe cassava mosaic disease in East Africa	123
Upsurge of <i>Myndus crudus</i> , the vector of the phytoplasma inducing lethal yellowing disease of palm, and rapid disease spread following Hurricane Mitch	126
Divergence of aphids on non-cultivated hosts: determining haplotypes and plant hosts using a mitochondrial marker	129
Tracking Mediterranean fruit fly introductions in California using composite genotypes	130
Conclusions	131
Acknowledgements	131
References	132
7. Predicting Evolutionary Change in Invasive, Exotic Plants and its Consequences for Plant-Herbivore Interactions	137
<i>H. Müller-Schärer and T. Steinger</i>	
Introduction	137
Framework and scope of our study	139
Selection pressure in invaded habitats and expected selection on plant traits	140
Properties of invaded habitats	140
General traits associated with plant invaders	141
Traits related to competitors and antagonists	141
Caveats	143
Genetic variation in invasive plants	145
Reduced genetic variation in invasive plant populations?	145
Caveat: low correlation between molecular- and quantitative-genetic variation	147
Increased genetic variance through hybridization	148
Observed evolutionary response	149
Outlook	153
Emerging research topics	154
Acknowledgements	155
References	155
8. Experimental Evolution in Host-Parasitoid Interactions	163
<i>A.R. Kraaijeveld</i>	
Introduction	163
Field 'experiments'	164
Experimental evolution in host-parasitoid systems	165
House flies	165
<i>Drosophila</i>	166
Discussion	173
Lack of genetic variation for resistance	173
Resistance is costly	174

Genotype \times genotype interactions	174
Parasitoids can evolve	174
Selection pressures fluctuate in space and time	175
Concluding thoughts	176
References	177
9. Interactions Between Natural Enemies and Transgenic Insecticidal Crops	183
<i>J.J. Obrycki, J.R. Ruberson and J.E. Losey</i>	
Introduction	183
<i>Bacillus thuringiensis</i> versus predators and parasitoids	185
Insect predators	186
Parasitoids	188
Field surveys of natural enemies in transgenic insecticidal fields	190
Predatory arthropods	190
Parasitoids	193
Insect pathogens	195
Risks and benefits of transgenic insecticidal crops for natural enemies	197
Conclusions	198
References	199
10. The GMO Guidelines Project: Development of International Scientific Environmental Biosafety Testing Guidelines for Transgenic Plants	207
<i>A. Hilbeck and the Steering Committee of the GMO Guidelines Project</i>	
Introduction	207
Needs assessment	210
Plant characterization	211
Non-target and biodiversity effects	212
Gene flow and its consequences	216
Resistance management	216
Conclusion	217
References	217
11. Genetic Manipulation of Natural Enemies: Can We Improve Biological Control by Manipulating the Parasitoid and/or the Plant?	219
<i>G.M. Poppy and W. Powell</i>	
Introduction	219
Genetic manipulation	220
Genetic manipulation of parasitoids	221
Parasitoid manipulation via the plant	226
Conclusions	228
References	229

12. Sex-ratio Distorters and Other Selfish Genetic Elements: Implications for Biological Control	235
<i>R. Stouthamer</i>	
Introduction	235
Overview of sex-ratio distorters and their potential application	236
Female-biasing sex-ratio distorters	236
Male-biasing sex-ratio distorters	243
Application of PSR factors in biocontrol	245
Other heritable bacteria of importance to biological control	245
Cytoplasmic incompatibility-inducing <i>Wolbachia</i>	245
Detection of sex-ratio distorters and CI- <i>Wolbachia</i> in natural enemies	247
Discussion	248
References	248
Index	253
