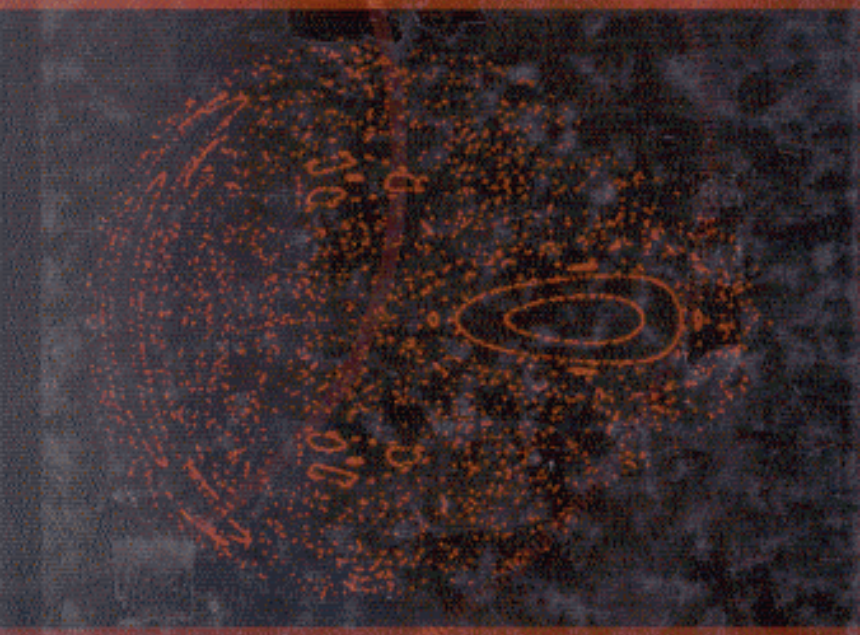
A Modern Approach to Classical Mechanics

Harald Iro



World Scientific

Contents

1 Introduction 1

1.1 Classical mechanics is challenging again 1

1.2 On the scientific method 3

1.3 Time, space and motion 7

2 The foundations of mechanics 11

2.1 Newton's laws 11

2.1.1 Mass, quantity of motion and force 11

2.1.2 The fundamental laws of classical mechanics 12

2.1.3 Mechanics of a point mass 15

2.2 First integrals of Newton's equation of motion 16

2.2.1 Constants of motion and conserved quantities 16

2.2.2 Conservation of energy 19

2.2.3 Angular momentum and its conservation 23

3 One-dimensional motion of a particle 27

3.1 Examples of one-dimensional motion 27

3.2 General features 29

3.3 The inclined track 33

3.4 The plane pendulum 34

3.5 The harmonic oscillator 37

3.6 The driven, damped oscillator 40

3.6.1 The driven oscillator with linear damping 40

3.6.2 The periodically driven, damped oscillator 42

3.7 Stability of motion 45

3.7.1 Two examples 45

3.7.2 Linear stability analysis 47

3.8 Anharmonic one-dimensional motion 53

4 Encountering peculiar motion in two dimensions 59
4.1 The two-dimensional harmonic oscillator 59
4.2 The Hénon-Heiles system 66
4.3 A 'useless' conserved quantity 72
4.4 Chaotic behavior 75
4.5 Laplace's clock mechanism does not exist 83

5 Motion in a central force field 85
5.1 General features of the motion 85
5.1.1 Conserved quantities 85
5.1.2 The effective potential 88
5.1.3 Properties of the orbits 91
5.2 Motion in a $1/r$ potential 93
5.2.1 The case $L \neq 0$ 93
5.2.2 Bounded motion for $L = 0$ 99
5.3 Motion in the potential $V(r) \propto 1/r^{\alpha}$ 100
5.3.1 Mechanical similarity 102
5.4 The Runge-Lenz vector 103
5.5 Integrability vanishes 107
5.5.1 The homogeneous magnetic field as the sole force . . 108
5.5.2 Addition of a central force 114
5.5.3 Motion in the symmetry plane 115

6 The gravitational interaction of two bodies 119
6.1 Two-body systems 119
6.1.1 Center of mass and relative coordinates 122
6.1.2 Conserved quantities 124
6.2 The gravitational interaction 126
6.3 Kepler's laws 129
6.4 The gravitational potential of a body of finite size 136
6.4.1 The potential of a homogeneous sphere 137
6.4.2 The potential of an inhomogeneous body 139
6.5 On the validity of the gravitational law 141

7 Collisions of particles. Scattering 145
7.1 Unbounded motion in a central force field 145
7.2 Kinematics of two-particle-collisions 150
7.2.1 Elastic collisions of two particles 150
7.2.2 Kinematics of elastic collisions 153

7.3 Potential scattering 158
7.3.1 The scattering cross section 159
7.3.2 Scattering in the $1/r$ potential 161

8 Changing the frame of reference **167**
8.1 Inertial frames 169
8.2 Changing the inertial frame 169
8.3 Linear transformations of the coordinates 171
8.3.1 Translation of the coordinate system 171
8.3.2 Rotation of the coordinate system 172
8.4 The Galilean group 176
8.4.1 Transformation of forces 177
8.5 Transformations to non-inertial frames 179
8.5.1 Accelerated frames of reference 179
8.5.2 Rotating frames of reference 181
8.5.3 Motion in a rotating frame 185

9 Lagrangian mechanics **191**
9.1 Constraints 191
9.2 Calculus of variations 199
9.2.1 The Euler-Lagrange equation 200
9.2.2 Transforming the variables 204
9.2.3 Constraints 207
9.3 The Lagrangian 209
9.3.1 The inverse problem in the calculus of variations . . 209
9.3.2 The inverse problem for Newton's equation of motion 210
9.3.3 The Lagrangian for a single particle 213
9.3.4 Hamilton's principle 214
9.3.5 The Lagrangian in generalized coordinates 215
9.3.6 Further applications of the Lagrangian 220
9.3.7 Nonuniformly moving frames of reference 221

10 Conservation laws and symmetries in many particle systems **225**
10.1 The equations of motion for N point masses 225
10.2 The conservation laws 229
10.2.1 The motion of the center of mass 229
10.2.2 Conservation of angular momentum 231
10.2.3 Conservation of energy 234

10.3 The Lagrangian of a system of N particles 238
10.4 Infinitesimal transformations and conservation laws 241
10.4.1 Infinitesimal translations of time 241
10.4.2 Infinitesimal coordinate transformations 241
10.4.3 Galilean transformations and constants of motion . . 244

11 The rigid body **249**
11.1 Degrees of freedom of a rigid body 250
11.2 Some basics of statics 250
11.2.1 Historical survey 251
11.2.2 The machines 251
11.2.3 The physical principles 252
11.2.4 Simple applications 253
11.3 Dynamics of the rigid body 257
11.3.1 The motion of a rigid body 257
11.3.2 The inertia tensor 261
11.3.3 Euler's equations of motion 267
11.3.4 The motion of a spinning top 274
11.3.5 The symmetric spinning top 280

12 Small oscillations **291**
12.1 The double pendulum 291
12.2 The harmonic approximation 295
12.2.1 The general theory 295
12.2.2 The double pendulum (again) 299
12.2.3 Vibrations of a triatomic molecule 302
12.3 From the linear chain and vibrating string 309
12.3.1 The vibrating string 313

13 Hamilton's canonical formulation of mechanics **317**
13.1 Hamiltonian dynamics 318
13.1.1 The canonical equations 318
13.1.2 Motion in a central force and homogeneous magnetic field 323
13.1.3 Poisson brackets 329
13.2 Canonical transformations 331
13.2.1 The generating function of a transformation 332
13.2.2 Canonical invariants 337
13.2.3 Infinitesimal canonical transformations 338

13.2.4 Symmetries and conservation laws 341
13.2.5 The flux in phase space 342

14 Hamilton-Jacobi theory **347**
14.1 Integrability 347
14.2 Time-independent Hamilton-Jacobi theory 352
14.2.1 The Hamilton-Jacobi equation 352
14.2.2 Separation of variables 354
14.3 Three body systems 359
14.3.1 The restricted three body problem 360
14.3.2 The problem of two centers of gravitation 365
14.3.3 Solutions of the restricted three body problem 370
14.3.4 Is our planetary system also chaotic? 378

15 From integrable to non-integrable systems **381**
15.1 Action-angle variables 381
15.1.1 Definition and general properties 381
15.1.2 Transforming to action and angle variables 385
15.2 Dynamics on the torus 393
15.3 Canonical perturbation theory 396
15.3.1 The one-dimensional anharmonic oscillator 399
15.3.2 First order corrections 402
15.4 The KAM theorem (an outlook) 403
15.4.1 The modified Hénon-Heiles system 404
15.4.2 On the stability of planetary motion 406

In retrospect **411**

Appendix **413**

A Coordinate systems and some vector analysis **413**
A.1 The Euclidean space $\mathbf{E}^3$ 413
A.2 Cartesian coordinates 414
A.3 Orthogonal, curvilinear coordinates 416
A.3.1 General relations 416
A.3.2 Spherical coordinates 418
A.3.3 Cylindrical coordinates 420

B Rotations and tensors **421**
B.1 Rotations 421
B.2 Tensors 424

C Green's functions **425**
C.1 The Dirac δ-function 425
C.1.1 Distributions 425
C.1.2 The δ-function 425
C.2 Fourier transforms 427
C.3 Linear differential equations and Green's functions 428
C.3.1 The Green's function 428
C.3.2 The equation of the damped oscillator 429

Bibliography **433**

Index **437**
