

An Introduction to

# The Mechanical Properties of Solid Polymers

SECOND EDITION

I. M. WARD    J. SWEENEY

 WILEY

# Contents

<b>Preface</b>	<b>xi</b>
<b>1 Structure of Polymers</b>	<b>1</b>
1.1 Chemical composition	1
1.1.1 Polymerization	1
1.1.2 Cross-linking and chain-branching	3
1.1.3 Average molecular mass and molecular mass distribution	4
1.1.4 Chemical and steric isomerism and stereoregularity	5
1.1.5 Liquid crystalline polymers	7
1.1.6 Blends, grafts and copolymers	9
1.2 Physical structure	9
1.2.1 Rotational isomerism	9
1.2.2 Orientation and crystallinity	11
References	16
Further reading	16
<b>2 The Deformation of an Elastic Solid</b>	<b>19</b>
2.1 The state of stress	19
2.2 The state of strain	20
2.2.1 The engineering components of strain	21
2.3 The generalized Hooke's law	24
2.4 Finite strain elasticity: the behaviour of polymers in the rubber-like state	25
2.4.1 The definition of components of stress	25
2.4.2 The generalized definition of strain	26
2.4.3 The strain energy function	28
References	30
Further reading	30
<b>3 Rubber-Like Elasticity</b>	<b>31</b>
3.1 General features of rubber-like behaviour	31
3.2 The thermodynamics of deformation	33
3.3 The statistical theory	35
3.3.1 Simplifying assumptions	35

3.3.2	The average length of a molecule between cross-links	36
3.3.3	The entropy of a single chain	37
3.3.4	The elasticity of a molecular network	39
3.4	Modifications of the simple molecular network	43
3.5	Recent developments in the molecular theory of rubber elasticity	46
	References	51
	Problems for Chapters 2 and 3	51
<b>4</b>	<b>Principles of Linear Viscoelasticity</b>	<b>53</b>
4.1	Viscoelasticity as a phenomenon	53
4.1.1	Linear viscoelastic behaviour	54
4.1.2	Creep	55
4.1.3	Stress relaxation	58
4.2	Mathematical representation of linear viscoelasticity	59
4.2.1	The Boltzmann superposition principle	59
4.2.2	The stress relaxation modulus	63
4.2.3	Mechanical models, retardation and relaxation time spectra	63
4.3	Dynamic mechanical measurements: the complex modulus and complex compliance	70
4.3.1	Experimental patterns for $G_1$ , $G_2$ , etc. as a function of frequency	73
4.3.2	The Alfrey approximation	73
	References	76
	Problems for Chapter 4	76
<b>5</b>	<b>The Measurement of Viscoelastic Behaviour</b>	<b>79</b>
5.1	Creep and stress relaxation	80
5.1.1	Creep conditioning	80
5.1.2	Specimen characterization	80
5.1.3	Experimental precautions	80
5.2	Dynamic mechanical measurements	83
5.2.1	The torsion pendulum	83
5.2.2	Forced vibration methods	86
5.2.3	Dynamic mechanical thermal analysis (DMTA)	87
5.3	Wave-propagation methods	88
5.3.1	The kilohertz frequency range	88
5.3.2	The megahertz frequency range: ultrasonic methods	89
5.3.3	The hypersonic frequency range: Brillouin spectroscopy	92
	References	92
<b>6</b>	<b>Experimental Studies of Linear Viscoelastic Behaviour as a Function of Frequency and Temperature: Time-Temperature Equivalence</b>	<b>95</b>
6.1	General introduction	95
6.1.1	Amorphous polymers	95
6.1.2	Temperature dependence of viscoelastic behaviour	98
6.1.3	Crystallinity and inclusions	101

6.2	Time-temperature equivalence and superposition	101
6.3	Molecular interpretations of time-temperature equivalence	104
6.3.1	Molecular rate processes with a constant activation energy: the site model theory	104
6.3.2	The Williams-Landel-Ferry (WLF) equation	108
6.4	Flexible molecular chain models	113
6.4.1	Normal mode theories	113
6.4.2	The dynamics of highly entangled polymers	116
	References	119
<b>7</b>	<b>Anisotropic Mechanical Behaviour</b>	<b>121</b>
7.1	Elastic constants and polymer symmetry	121
7.1.1	Specimens possessing orthorhombic symmetry	122
7.1.2	Specimens possessing uniaxial symmetry, often termed transverse isotropy	123
7.2	Measuring elastic constants	125
7.2.1	Measurements on films or sheets	125
7.2.2	Measurements on filaments	129
7.3	Experimental studies of mechanical anisotropy in oriented polymers	131
7.3.1	Sheets of low-density polyethylene	132
7.3.2	Filaments tested at room temperature	134
7.4	Interpretation of mechanical anisotropy: general considerations	139
7.4.1	Theoretical calculations of elastic constants	139
7.4.2	Orientation and morphology	141
7.5	Experimental studies of anisotropic mechanical behaviour and their interpretation	142
7.5.1	The aggregate model and mechanical anisotropy	143
7.5.2	Correlation between the elastic constants of a highly oriented and an isotropic polymer	143
7.5.3	The development of mechanical anisotropy with molecular orientation	146
7.5.4	The anisotropy of amorphous polymers	149
7.5.5	Later applications of the aggregate model	150
7.6	The aggregate model for chain-extended polyethylene and liquid crystalline polymers	152
7.7	Auxetic materials: negative Poisson's ratio	157
	References	160
<b>8</b>	<b>Polymer Composites: Macroscale and Microscale</b>	<b>163</b>
8.1	Composites: a general introduction	163
8.2	Mechanical anisotropy of polymer composites	164
8.2.1	Mechanical anisotropy of lamellar structures	164
8.2.2	Elastic constants of highly aligned fibre composites	166
8.2.3	Mechanical anisotropy and strength of uniaxially aligned fibre composites	169

8.3	Short fibre composites	170
8.3.1	The influence of fibre length: shear lag theory	171
8.3.2	Debonding and pull-out	173
8.3.3	Partially oriented fibre composites	174
8.4	Takayanagi models for semicrystalline polymers	174
8.4.1	The simple Takayanagi model	175
8.4.2	Takayanagi models for dispersed phases	177
8.4.3	Modelling polymers with a single-crystal texture	179
8.5	Ultrahigh-modulus polyethylene	184
8.5.1	The crystalline fibril model	184
8.5.2	The crystalline bridge model	187
8.6	Conclusions	190
	References	190
	Problems for Chapters 7 and 8	191
<b>9</b>	<b>Relaxation Transitions: Experimental Behaviour and Molecular Interpretation</b>	<b>193</b>
9.1	Amorphous polymers: an introduction	193
9.2	Factors affecting the glass transition in amorphous polymers	194
9.2.1	Effect of chemical structure	195
9.2.2	Effect of molecular mass and cross-linking	197
9.2.3	Blends, grafts and copolymers	198
9.2.4	Effect of plasticizers	200
9.3	Relaxation transitions in crystalline polymers	202
9.3.1	General introduction	202
9.3.2	Relaxation in low crystallinity polymers	203
9.3.3	Relaxation processes in polyethylene	205
9.3.4	Relaxation processes in liquid crystalline polymers	212
9.4	Conclusions	216
	References	216
<b>10</b>	<b>Creep, Stress Relaxation and Non-linear Viscoelasticity</b>	<b>219</b>
10.1	The engineering approach	220
10.1.1	Isochronous stress-strain curves	220
10.2	The rheological approach	220
10.2.1	Adaptations of linear theory – differential models	221
10.2.2	Adaptations of linear theory – integral models	224
10.2.3	More complicated single-integral representations	228
10.2.4	Comparison of single-integral models	231
10.3	Creep and stress relaxations as thermally activated processes	231
10.3.1	The Eyring equation	231
10.3.2	Applications of the Eyring equation to creep	233
10.3.3	Applications of the Eyring equation to stress relaxation	236
10.3.4	Applications of the Eyring equation to yield	238
	References	239

<b>11</b>	<b>Yielding and Instability in Polymers</b>	<b>241</b>
11.1	Discussion of load–elongation curves in tensile testing	242
11.1.1	Necking and the ultimate stress	243
11.1.2	Necking and cold-drawing: a phenomenological discussion	246
11.1.3	Use of the Considère construction	247
11.1.4	Definition of yield stress	249
11.2	Ideal plastic behaviour	250
11.2.1	The yield criterion: general considerations	250
11.2.2	The Tresca yield criterion	251
11.2.3	The Coulomb yield criterion	251
11.2.4	The von Mises yield criterion	253
11.2.5	Geometrical representations of the Tresca, von Mises and Coulomb yield criteria	255
11.2.6	Combined stress states	256
11.3	Historical development of understanding of the yield process	258
11.3.1	Adiabatic heating	258
11.3.2	The isothermal yield process: the nature of the load drop	260
11.4	Experimental evidence for yield criteria in polymers	261
11.4.1	Application of Coulomb yield criterion to yield behaviour	261
11.4.2	Direct evidence of the influence of hydrostatic pressure on yield behaviour	262
11.5	The molecular interpretations of yield and cold-drawing	266
11.5.1	Yield as an activated rate process: the Eyring equation	266
11.5.2	Alternative models: nucleation-controlled mechanisms	266
11.5.3	Pressure dependence and general states of stress	267
11.6	Cold-drawing	268
11.6.1	General considerations	268
11.6.2	The natural draw ratio, maximum draw ratios and molecular networks	269
11.6.3	Crystalline polymers	270
	References	270
<b>12</b>	<b>Breaking Phenomena</b>	<b>273</b>
12.1	Definition of tough and brittle behaviour in polymers	273
12.2	Principles of brittle fracture of polymers	274
12.2.1	Griffith fracture theory	274
12.2.2	The Irwin model	275
12.2.3	The strain energy release rate	277
12.3	Controlled fracture in brittle polymers	280
12.4	Crazing in glassy polymers	281
12.5	The structure and formation of crazes	286
12.5.1	The structure of crazes	288
12.5.2	Craze initiation and growth	291
12.5.3	Crazing in the presence of fluids and gases: environmental crazing	295
12.6	Controlled fracture in tough polymers	296
12.6.1	The $J$ -integral	298
12.6.2	Essential work of fracture	302

12.6.3	Crack opening displacement	305
12.7	The molecular approach	307
12.8	Factors influencing brittle–ductile behaviour: brittle–ductile transitions	310
12.8.1	The Ludwig–Davidenkov–Orowan hypothesis	310
12.8.2	Notch sensitivity and Vincent's $\sigma_B$ – $\sigma_Y$ diagram	311
12.9	The impact strength of polymers	315
12.9.1	Flexed-beam impact	315
12.9.2	Falling-weight impact	319
12.9.3	Toughened polymers: high-impact polyblends	321
12.9.4	Crazing and stress whitening	322
12.9.5	Dilatation bands	324
12.10	The tensile strength and tearing of polymers in the rubbery state	325
12.10.1	The tearing of rubbers: extension of Griffith theory	325
12.10.2	Molecular theories of the tensile strength of rubbers	326
12.11	Effect of strain rate and temperature	328
12.12	Fatigue in polymers	331
	References	335
	Problems for Chapters 11 and 12	339
<b>Appendix 1</b>		<b>341</b>
A1.1	Scalars, vectors and tensors	341
A1.2	Tensor components of stress	341
A1.3	Tensor components of strain	342
A1.4	Generalized Hooke's law	342
A1.5	Engineering strains and matrix notation	343
A1.6	The elastic moduli of isotropic materials	345
A1.7	Transformation of tensors from one set of coordinate axes to another	347
A1.8	The Mohr circle construction	350
	References	351
<b>Appendix 2</b>		<b>353</b>
A2.1	Rivlin, Mooney, Ogden	353
	References	356
