CONTENTS

Introduction	1
1 Fundamental Concepts and Equations	5
1.1 Some mathematical concepts and notation	6
1.1.1 Basic notation	6
1.1.2 Differential operators	7
1.1.3 Transformations of Cartesian coordinates	9
1.1.4 Hölder-continuous and Lipschitz-continuous functions	10
1.1.5 Symbols ‘o’ and ‘O’	10
1.1.6 Measure and integral	10
1.1.7 Description of the boundary	10
1.1.8 Measure on the boundary of a domain	11
1.1.9 Green’s theorem.	12
1.1.10 Lebesgue spaces	12
1.1.11 One auxiliary result	14
1.2 Governing equations and relations of gas dynamics	14
1.2.1 Description of the flow	15
1.2.2 The transport theorem	17
1.2.3 The continuity equation	20
1.2.4 The equations of motion	21
1.2.5 The equations of motion of general fluids	23
1.2.6 The law of conservation of the moment of momentum; symmetry of the stress tensor	23
1.2.7 The Navier–Stokes equations	24
1.2.8 Properties of the viscosity coefficients	25
1.2.9 The Reynolds number	25
1.2.10 Various forms of the Navier–Stokes equations	26
1.2.11 The energy equation	26
1.2.12 Thermodynamical relations	28
1.2.13 Entropy	29
1.2.14 The second law of thermodynamics	30
1.2.15 Dissipation form of the energy equation	30
1.2.16 Entropy form of the energy equation	32
1.2.17 Adiabatic flow	32
1.2.18 Barotropic flow	33
1.2.19 Complete system describing the flow of a heat-conductive gas	34
1.2.20 Speed of sound; Mach number	35
1.2.21 Simplified models	35

1.2.22 Initial and boundary conditions	36
1.2.23 Dimensionless form of gas dynamics equations	38
1.3 Some advanced mathematical concepts and results	40
1.3.1 Spaces of continuous, Hölder-continuous and continuously differentiable functions	40
1.3.2 Distributions	41
1.3.3 Sobolev spaces	43
1.3.4 Functions with values in Banach spaces	46
1.4 Survey of concepts and results from functional analysis	48
1.4.1 Linear vector spaces	48
1.4.2 Normed linear space	49
1.4.3 Duals to Banach spaces, weak and weak-* topologies	51
1.4.4 Riesz representation theorem	53
1.4.5 Operators	53
1.4.6 Lax Milgram lemma	55
1.4.7 Imbeddings	55
1.4.8 Solution of nonlinear operator equations	56
2 Basic facts from the theory of the Euler and Navier-Stokes equations	57
2.1 Hyperbolic systems and the Euler equations	57
2.2 Existence of smooth solutions	58
2.2.1 Hyperbolic systems and characteristics	58
2.2.2 Formulation of the hyperbolic problem	60
2.2.3 Linear scalar equation	61
2.2.4 Solution of a linear system	62
2.2.5 Nonlinear scalar equation	63
2.2.6 Symmetric hyperbolic systems	65
2.2.7 Quasilinear system	66
2.2.8 Local existence for a quasilinear system	67
2.2.9 Local existence for equations of inviscid barotropic flow	67
2.3 Weak solutions	68
2.3.1 Blow up of classical solutions	69
2.3.2 Generalized formulation for systems of conservation laws	70
2.3.3 Examples of piecewise smooth weak solutions	73
2.3.4 Entropy condition	76
2.3.5 Entropy in fluid mechanics	79
2.3.6 Method of artificial viscosity	80
2.3.7 Existence and uniqueness of weak entropy solutions for scalar conservation laws	81
2.3.8 Riemann problem	81

2.3.9 Linear Riemann problem	82
2.3.10 Nonlinear Riemann problem	83
2.3.11 Existence result for the 2×2 Euler system of barotropic flow	88
2.3.12 Global existence results for general 1D systems	91
2.4 Nonstationary Navier–Stokes equations of compressible flow	92
2.4.1 Results for the full system of compressible Navier–Stokes equations	92
2.4.2 Results for equations of barotropic flow	94
2.5 Existence results for stationary compressible Navier–Stokes equations	96
2.5.1 Existence of a regular solution for small data	97
2.5.2 Existence of weak solutions for barotropic flow	98
3 Finite difference and finite volume methods for nonlinear hyperbolic systems and the Euler equations	100
3.1 Further properties of the Euler equations	101
3.1.1 The Euler equations	101
3.1.2 Diagonalization of the Jacobi matrix	104
3.1.3 Rotational invariance of the Euler equations in 3D	107
3.1.4 Hyperbolicity of the Euler equations in 3D	108
3.1.5 The 2D case	109
3.1.6 Solution of the Riemann problem for 1D Euler equations	112
3.1.7 Solution of the Riemann problem for the split 3D Euler equations	138
3.2 Numerical methods for hyperbolic systems with one space variable	141
3.2.1 Example of a nonconservative scheme	143
3.2.2 Semidiscretization in space	144
3.2.3 Space-time nonuniform grid	145
3.2.4 Qualitative properties of numerical schemes for conservation laws	145
3.2.5 Order of the scheme	146
3.2.6 Stability of the scheme	147
3.2.7 Stability in a nonlinear case	149
3.2.8 Lax–Friedrichs scheme	150
3.2.9 Stability of the Lax–Friedrichs scheme	150
3.2.10 Lax–Wendroff scheme	154
3.2.11 Stability of the Lax–Wendroff scheme	155
3.2.12 The Godunov method	156
3.2.13 Riemann solver for a scalar equation	156

3.2.14 Engquist–Osher scheme	157
3.2.15 Riemann numerical flux for a linear system	158
3.2.16 Riemann solver for a nonlinear hyperbolic system	162
3.2.17 Flux vector splitting schemes for the Euler equations with one space variable	162
3.2.18 The Roe scheme	164
3.2.19 Consistency of the schemes	172
3.2.20 Linear stability of flux vector splitting schemes	172
3.2.21 Higher order schemes	172
3.2.22 ENO and WENO schemes	178
3.3 The finite volume method for the multidimensional Euler equations	183
3.3.1 Finite volume mesh	185
3.3.2 Derivation of a general finite volume scheme	195
3.3.3 Properties of the numerical flux	197
3.3.4 Construction of some numerical fluxes	197
3.3.5 Another construction of the multidimensional numerical flux	198
3.3.6 Boundary conditions	199
3.3.7 Stability of the finite volume schemes	203
3.3.8 FV schemes on 2D uniform rectangular meshes	204
3.3.9 Von Neumann linear stability	205
3.3.10 Application to the Lax–Friedrichs scheme	206
3.3.11 Extension of the stability conditions to the Euler equations	211
3.3.12 Convergence of the finite volume method	212
3.3.13 Entropy condition	213
3.3.14 Implicit FV methods	215
3.4 Osher–Solomon scheme	219
3.4.1 Approximate Riemann solver	220
3.4.2 The Jacobi matrix of \mathbf{f}_1	221
3.4.3 Riemann invariants	222
3.4.4 Integration of the eigenvectors \mathbf{r}_ℓ	223
3.4.5 Integration path in the admissible state set	224
3.4.6 Osher–Solomon approximate Riemann solver	225
3.4.7 Inlet/outlet boundary conditions	227
3.4.8 Solid wall boundary conditions	232
3.4.9 Osher–Solomon scheme for the 2D Euler equations	233
3.5 Higher order finite volume schemes	235
3.5.1 General form of a ‘second order’ MUSCL-type FV scheme	235
3.5.2 Computation of the approximate gradient	236

3.5.3	Linear extrapolation	238
3.5.4	Limitation procedure	238
3.5.5	The choice of variables u_ℓ	239
3.5.6	Test of the accuracy of MUSCL-type schemes	240
3.6	Adaptive methods	243
3.6.1	Geometrical data structure	243
3.6.2	Adaptation algorithm	244
3.6.3	Mesh refinement	245
3.6.4	Adaptation techniques based on constant recovery	249
3.6.5	Adaptation techniques based on linear recovery	257
3.6.6	Data reinitialization for the mesh refinement	259
3.6.7	Anisotropic mesh adaptation	259
3.6.8	Data reinitialization for anisotropic mesh refinement	272
3.7	Examples of finite volume simulations	273
3.7.1	Shock-tube problem	275
3.7.2	GAMM channel	277
3.7.3	The 3D channel 10% cylindrical bump	284
3.7.4	The 3D channel with 25% spherical bump	290
3.7.5	Flow past NACA 0012 airfoil	296
3.7.6	Flow past a cascade of profiles	303
3.7.7	Scramjet	311
4	Finite element solution of compressible flow	316
4.1	Finite element method – elementary treatment	317
4.1.1	Elliptic problems	318
4.1.2	Finite element discretization of the elliptic problem	320
4.1.3	Convergence of the FEM	325
4.1.4	Several additional remarks	330
4.1.5	Parabolic problems	331
4.1.6	Finite element discretization of the parabolic problem	333
4.1.7	Stability and convergence	335
4.1.8	Mass lumping	341
4.1.9	Singularly perturbed and hyperbolic problems	341
4.1.10	Streamline diffusion method	346
4.1.11	Discontinuous Galerkin FEM for a linear hyperbolic problem	356
4.1.12	Adaptive mesh refinement and a posteriori error estimates	361
4.2	Finite element solution of viscous barotropic flow	367
4.2.1	Continuous problem	367

4.2.2	Discrete problem	369
4.2.3	Existence and uniqueness of the approximate solution	370
4.2.4	Discrete problem with nonhomogeneous boundary conditions	372
4.3	Finite element solution of a heat-conductive gas flow	375
4.3.1	Continuous problem	376
4.3.2	Symmetrization of the Euler and Navier-Stokes equations	383
4.3.3	Galerkin finite element space semidiscretization and its stabilization	385
4.3.4	Analysis of a linear model system with one space variable	388
4.3.5	Multidimensional problems	393
4.3.6	Time discretization	403
4.4	Combined finite volume–finite element method for viscous compressible flow	407
4.4.1	Computational grids	408
4.4.2	FV and FE spaces	409
4.4.3	Space semidiscretization of the problem	412
4.4.4	Time discretization	415
4.4.5	Realization of boundary conditions in the convective form b_h	416
4.4.6	Operator splitting	416
4.4.7	Applications of the combined FV–FE methods	419
4.4.8	Computation of the drag and lift	428
4.5	Theory of the combined FV–FE method	434
4.5.1	Continuous problem	435
4.5.2	Semi-implicit method combining dual finite volumes with conforming finite elements	439
4.5.3	Convergence of the semi-implicit scheme	443
4.5.4	Explicit method combining conforming finite elements with dual finite volumes	452
4.5.5	Combination of barycentric finite volumes with nonconforming finite elements	458
4.6	Discontinuous Galerkin finite element method	465
4.6.1	DGFEM for a scalar conservation law with one space variable	466
4.6.2	Realization of the discrete problem	469
4.6.3	Investigation of the order of the DGFEM	470
4.6.4	DGFEM for multidimensional problems	475
4.6.5	An example of implementation	479
4.6.6	Problem with periodic boundary conditions	481
4.6.7	Limiting of the order of accuracy	482

CONTENTS	xiii
4.6.8 Approximation of the boundary	489
4.6.9 DGFEM for convection-diffusion problems and viscous flow	492
4.6.10 Numerical examples	501
References	507
