

SOLID MECHANICS AND ITS APPLICATIONS

Viorel Arnăutu and Pekka Neittaanmäki

# Optimal Control from Theory to Computer Programs

KLUWER ACADEMIC PUBLISHERS

# Contents

Foreword	IX
1. SELECTED TOPICS FROM FUNCTIONAL AND CONVEX ANALYSIS	1
1    Differentiability topics	1
2    Convex functionals	9
2. OPTIMIZATION PROBLEMS	23
1    Existence and uniqueness results for minimization problems	23
2    The Azimuth Mark method	28
3    The steepest descent method	31
4    Projection operators in Hilbert spaces	38
5    Projected gradient methods	40
3. NUMERICAL APPROXIMATION OF ELLIPTIC VARIATIONAL PROBLEMS	47
1    An Example from Fluid Mechanics problems in media with semi-permeable boundaries	47
2    The general form of Elliptic Variational Inequalities	53
3    The internal approximation of Elliptic Variational Inequalities	58
4    The Finite Element Method. Error Estimates	64
5    Optimization Methods	75
5.1    The successive approximations method	75
5.2    The penalization method	76
5.3    The Lagrange multipliers method	81
6    Computer realization of the optimization methods	86
6.1    The seepage flow of water through a homogeneous rectangular dam	87
6.2    The successive approximations method	90

6.3	The penalization method	95
6.4	The Lagrange multipliers method	102
4.	INDIRECT METHODS FOR OPTIMAL CONTROL PROBLEMS	109
1	The elimination of the state	109
2	An optimal control problem related to the inverse Stefan problem	117
2.1	The one-phase Stefan problem	117
2.2	The inverse Stefan problem and the related optimal control problem	120
2.3	The numerical realization of the Algorithm ALG-R	127
3	Optimal control for a two-phase Stefan Problem	143
3.1	The two-phase Stefan Problem	143
3.2	The optimal control problem	150
3.3	A numerical algorithm	158
5.	A CONTROL PROBLEM FOR A CLASS OF EPIDEMICS	163
1	Statement of the control problem	163
2	The numerical realization of the algorithm	171
6.	OPTIMAL CONTROL FOR PLATE PROBLEMS	185
1	Decomposition of fourth order elliptic equations	185
2	The clamped plate problem	187
3	Optimization of plates	200
4	A Fourth-Order Variational Inequality	205
7.	DIRECT NUMERICAL METHODS FOR OPTIMAL CONTROL PROBLEMS	213
1	The abstract optimal control problem	214
2	The quadratic programming problem	215
3	Interior-point methods for the solution of problem (QP)	220
4	Numerical solution of the linear system	230
4.1	Krylov subspace algorithms	230
4.2	Convergence properties	233
4.3	The implementation of the algorithms	234
5	Preconditioning	247
5.1	Preconditioning for MINRES and SYMMLQ	247
5.2	Preconditioning for the KKT system	254

<i>Contents</i>	vii
<b>8. STOCHASTIC CONTROL PROBLEMS</b>	<b>269</b>
1     Stochastic processes	269
2     Stochastic control problems. An introduction	281
3     The Hamilton–Jacobi–Bellman equations	287
4     The Markov chain approximation	290
5     Numerical algorithms	303
5.1     Approximation in Policy Space	304
5.2     Approximation in Value Space	306
5.3     Computational Problems	309
