

Optimal Measurement Methods for Distributed Parameter System Identification

Dariusz Uciński

CRC PRESS

Contents

Preface	xv
1 Introduction	1
1.1 The optimum experimental design problem in context	1
1.2 A general review of the literature	3
2 Key ideas of identification and experimental design	9
2.1 System description	9
2.2 Parameter identification	13
2.3 Measurement-location problem	14
2.4 Main impediments	19
2.4.1 High dimensionality of the multimodal optimization problem	19
2.4.2 Loss of the underlying properties of the estimator for finite horizons of observation	20
2.4.3 Sensor clusterization	20
2.4.4 Dependence of the solution on the parameters to be identified	22
2.5 Deterministic interpretation of the FIM	24
2.6 Calculation of sensitivity coefficients	27
2.6.1 Finite-difference method	27
2.6.2 Direct-differentiation method	28
2.6.3 Adjoint method	29
2.7 A final introductory note	31
3 Locally optimal designs for stationary sensors	33
3.1 Linear-in-parameters lumped models	33
3.1.1 Problem statement	34
3.1.2 Characterization of the solutions	38
3.1.3 Algorithms	49
3.2 Construction of minimax designs	68
3.3 Continuous designs in measurement optimization	74
3.4 Clusterization-free designs	83
3.5 Nonlinear programming approach	88
3.6 A critical note on a deterministic approach	92
3.7 Modifications required by other settings	95

3.7.1	Discrete-time measurements	95
3.7.2	Multiresponse systems and inaccessibility of state measurements	95
3.7.3	Simplifications for static DPSs	96
3.8	Summary	100
4	Locally optimal strategies for scanning and moving observations	103
4.1	Optimal activation policies for scanning sensors	103
4.1.1	Exchange scheme based on clusterization-free designs	105
4.1.2	Scanning sensor scheduling as a constrained optimal control problem	118
4.1.3	Equivalent Mayer formulation	120
4.1.4	Computational procedure based on the control parameterization-enhancing technique	121
4.2	Adapting the idea of continuous designs for moving sensors	125
4.2.1	Optimal time-dependent measures	125
4.2.2	Parameterization of sensor trajectories	129
4.3	Optimization of sensor trajectories based on optimal-control techniques	131
4.3.1	Statement of the problem and notation	131
4.3.2	Equivalent Mayer problem and existence results	134
4.3.3	Linearization of the optimal-control problem	136
4.3.4	A numerical technique for solving the optimal measurement problem	137
4.3.5	Special cases	142
4.4	Concluding remarks	149
5	Measurement strategies with alternative design objectives	153
5.1	Optimal sensor location for prediction	153
5.1.1	Problem formulation	153
5.1.2	Optimal-control formulation	155
5.1.3	Minimization algorithm	156
5.2	Sensor location for model discrimination	159
5.2.1	Competing models of a given distributed system	160
5.2.2	Theoretical problem setup	161
5.2.3	T_{12} -optimality conditions	164
5.2.4	Numerical construction of T_{12} -optimum designs	167
5.3	Conclusions	171
6	Robust designs for sensor location	173
6.1	Sequential designs	173
6.2	Optimal designs in the average sense	175
6.2.1	Problem statement	175
6.2.2	Stochastic-approximation algorithms	177

6.3	Optimal designs in the minimax sense	181
6.3.1	Problem statement and characterization	181
6.3.2	Numerical techniques for exact designs	182
6.4	Robust sensor location using randomized algorithms	187
6.4.1	A glance at complexity theory	188
6.4.2	NP-hard problems in control-system design	190
6.4.3	Weakened definitions of minima	191
6.4.4	Randomized algorithm for sensor placement	193
6.5	Concluding remarks	198
7	Towards even more challenging problems	201
7.1	Measurement strategies in the presence of correlated observations	201
7.1.1	Exchange algorithm for Ψ -optimum designs	203
7.2	Maximization of an observability measure	209
7.2.1	Observability in a quantitative sense	210
7.2.2	Scanning problem for optimal observability	211
7.2.3	Conversion to finding optimal sensor densities	212
7.3	Summary	216
8	Applications from engineering	217
8.1	Electrolytic reactor	217
8.1.1	Optimization of experimental effort	219
8.1.2	Clusterization-free designs	220
8.2	Calibration of smog-prediction models	221
8.3	Monitoring of groundwater resources quality	225
8.4	Diffusion process with correlated observational errors	230
8.5	Vibrating H-shaped membrane	232
9	Conclusions and future research directions	237
	Appendices	245
A	List of symbols	247
B	Mathematical background	251
B.1	Matrix algebra	251
B.2	Symmetric, nonnegative definite and positive-definite matrices	255
B.3	Vector and matrix differentiation	260
B.4	Convex sets and convex functions	264
B.5	Convexity and differentiability of common optimality criteria	267
B.6	Differentiability of spectral functions	268
B.7	Monotonicity of common design criteria	271
B.8	Integration with respect to probability measures	272

B.9	Projection onto the canonical simplex	274
B.10	Conditional probability and conditional expectation	275
B.11	Some accessory inequalities from statistical learning theory	277
B.11.1	Hoeffding's inequality	277
B.11.2	Estimating the minima of functions	278
C	Statistical properties of estimators	279
C.1	Best linear unbiased estimators in a stochastic-process setting	279
C.2	Best linear unbiased estimators in a partially uncorrelated framework	284
D	Analysis of the largest eigenvalue	289
D.1	Directional differentiability	289
D.1.1	Case of the single largest eigenvalue	289
D.1.2	Case of the repeated largest eigenvalue	292
D.1.3	Smooth approximation to the largest eigenvalue	293
E	Differentiation of nonlinear operators	297
E.1	Gâteaux and Fréchet derivatives	297
E.2	Chain rule of differentiation	298
E.3	Partial derivatives	298
E.4	One-dimensional domains	299
E.5	Second derivatives	299
E.6	Functionals on Hilbert spaces	300
E.7	Directional derivatives	301
E.8	Differentiability of max functions	301
F	Accessory results for PDEs	303
F.1	Green formulae	303
F.2	Differentiability w.r.t. parameters	304
G	Interpolation of tabulated sensitivity coefficients	313
G.1	Cubic spline interpolation for functions of one variable	313
G.2	Tricubic spline interpolation	314
H	Differentials of Section 4.3.3	321
H.1	Derivation of formula (4.126)	321
H.2	Derivation of formula (4.129)	322
I	Solving sensor-location problems using MAPLE & MATLAB	323
I.1	Optimum experimental effort for a 1D problem	323
I.1.1	Forming the system of sensitivity equations	324
I.1.2	Solving the sensitivity equations	325
I.1.3	Determining the FIMs associated with individual spatial points	327
I.1.4	Optimizing the design weights	327

I.1.5	Plotting the results	328
I.2	Clusterization-free design for a 2D problem	329
I.2.1	Solving sensitivity equations using the PDE Toolbox .	329
I.2.2	Determining potential contributions to the FIM from individual spatial points	335
I.2.3	Iterative optimization of sensor locations	336
