

The **polyurethanes** book

Editors: David Randall and Steve Lee

 **WILEY**

Contents

<i>Chapter</i>	<i>Page</i>	<i>Chapter</i>	<i>Page</i>
1. Introduction to polyurethanes	1	Raw materials used in polyurethanes	42
Cost and processing advantages	3	Isocyanates	42
Properties of polyurethanes	3	Polyol blends	43
Types of polyurethanes	4	Pre-formulated mixtures	44
Applications of polyurethanes	6	Thermoplastic polyurethanes	44
Industry structure	7	Handling of polyurethane chemicals	44
Future trends	8	Occupational hygiene monitoring for isocyanates	46
2. The global polyurethanes market	9	Storage and transport of polyurethane chemicals	47
Drivers for growth	9	Drum stock	47
Technology growth factors	12	Intermediate bulk containers (IBCs)	48
Supply and demand balance	13	Bulk storage	48
Applications	16	Manufacture and handling of polyurethanes in the factory	49
Automotive	17	Flexible foam	49
Coatings	18	Rigid foam	50
Construction	18	Thermoplastic polyurethanes	51
Footwear	19	Use of polyurethanes	51
Furniture	20	Polyurethanes and fire	51
Thermal insulation	20	Flexible foam and fire	53
Replacement challenges	21	Furniture and mattresses	53
3. The life-cycle of polyurethanes	23	Automotive	55
Life-Cycle Assessment (LCA)	24	Flame retardancy	55
Polyurethane raw materials production phase	26	Test methods	56
The product manufacture phase	28	Rigid foams, composite wood panels and fire	58
Polyurethane factory emissions	28	USA	59
Production waste and scrap	29	China	60
The use phase	30	EU and EFTA	60
Energy efficiency	30	Performance-based codes	61
Ecolabels	32	Other polyurethane applications and fire	61
Environmental declarations	33	Effluents from a fire	61
Indoor air	34		
End-of-life phase	35	5. Isocyanates	63
Waste management of polyurethanes	35	Reaction chains	63
4. Product Stewardship	39	Benzene to MDI	63
Regulatory framework	40	Toluene to MDI	64
Product design and development	40	Hexamethylene diamine to HDI (and derivatives)	64

<i>Chapter</i>	<i>Page</i>	<i>Chapter</i>	<i>Page</i>
Acetone to IPDI and derivatives including other uses for isophorone and IPDA	64	Structure	98
MDA (DADPM) to H ₁₂ MDI	69	Propylene oxide-ethylene oxide polyether polyols	99
Nitration process	70	Standard polyether polyols	101
Hydrogenation process	71	Rigid foam applications	101
Liquid slurry phase process	72	Flexible foam applications	103
Liquid-vapour slurry phase process (aniline)	72	Modified polyether polyols	104
Vapour phase fixed bed (aniline)	72	Graft dispersions	104
Vapour phase fluidised bed (aniline)	73	Amine-terminated polyethers	106
Aniline from phenol	73	Polyether polyols from tetrahydrofuran	106
Aniline-formaldehyde condensation	73	Polyester polyols	107
Phosgenation process	76	Linear or lightly branched aliphatic polyester polyols	108
Purification	78	Polycaprolactones	110
Isocyanate derivatives	79	Aromatic polyester polyols	110
Analysis	80	Polycarbonate polyols	111
Isocyanate value	80	Miscellaneous polyols	111
Hydrolysable chlorine	80	Quality and analysis	112
Ionisable chlorine	81		
Acidity	81	7. Outline of polyurethane chemistry	113
Viscosity	81	Isocyanates	113
Gas chromatography	82	Isocyanate reactions with hydroxyl	114
Storage/transportation	82	Isocyanate reaction with water	115
Isocyanate product characteristics	82	Isocyanate reaction with amines	116
MDI	83	Isocyanate reaction with urea	116
Polymeric MDI	84	Isocyanate reaction with urethanes	117
TDI	86	Isocyanate reactions with isocyanates	118
NDI	86	Other reactions of isocyanates	121
HDI	87	Polyurethane degradation reactions	123
IPDI	87	Polyether polyol	123
H ₁₂ MDI	87	Polyester polyol	125
Other diisocyanates	87	Ultra-violet radiation	125
Alternatives to phosgene	87	Physical chemistry	126
6. Polyols	89		
Manufacture of propylene oxide	89	8. Blowing agents	127
Chlorohydrin process	89	Montreal Protocol and other regulations	128
Hydroperoxidation	91	Blowing agents	131
Propylene oxide polyether polyols	93	Hydrochlorofluorocarbons (HCFCs)	132
Anionic polymerisation with potassium hydroxide	94	Hydrofluorocarbons (HFCs)	132
Product purification	96	Hydrocarbons (HCs)	133
Side reactions	96	Liquid carbon dioxide and other physical blowing agents	134
Alternative catalysts	97	Chemical blowing	134

<i>Chapter</i>	<i>Page</i>	<i>Chapter</i>	<i>Page</i>
Selection criteria	135	Viscosity reducers	167
Environmental considerations	135	UV resistance	167
Feasibility	136		
Performance	136	11. Introduction to flexible foams	169
9. Catalysts	137	Markets	169
Preparation of amine catalysts	137	Raw material history	169
Preparation of organotin catalysts	139	Basic flexible foam chemistry	171
Reaction mechanisms	141	Foam and polymer morphology	174
Amine catalysts	141	Cellular structure	175
Organotin catalysts	143	Polymer morphology	175
Isocyanurate catalysts	145	Functionality and performance tests	
Reaction kinetics	145	for flexible foams	177
Traditional experiments	147	Basic properties	179
Model systems	147	Durability cushioning/comfort	
FTIR experiments	148	tests	180
Ion viscosity	150	Ageing tests	187
		Fire test methods	188
10. Additives	151	Environmental performance	188
Blowing agents	151		
Catalysts	151	12. Moulded foams for automotive seating,	
Flexible foams	151	sound insulation and furniture	189
Rigid foams	152	Applications	189
Coatings, adhesives, sealants		Automotive seating	190
and encapsulants	153	Sound insulation foams	192
Surfactants	156	Moulded furniture foams	193
Structural parameters of silicone		Raw materials and formulations	193
surfactants	157	Cold-cure foams	194
Flexible foams	158	Hot-cure foams	197
Rigid foams	159	Processing of flexible foams	198
Elastomers and other applications	160	Cold-cure moulding	199
Fire retardants	160	Hot-cure moulding	202
Flexible foams	162		
Rigid foams	162	13. Slabstock foams	203
Other applications	162	Foam technologies	203
Cross-linking agents, chain-extending		Raw materials and formulations	204
agents and their reactions	163	Polyester foams	206
Other additives	163	Conventional polyether foams	207
Adhesion promoters	163	High-resilience foams	208
Anti-static	163	Processing technologies	211
Anti-oxidants	165	Foam machinery	212
Fillers	165	Foam curing	214
Hydrolysis	166	Carbon dioxide-assisted blowing	214
Lubricants	166	Variable pressure foaming	214
Anti-microbials	167	Batch-block	215
Pigments	167	Scorch	215
		Post-processing of slabstock foam	216

<i>Chapter</i>	<i>Page</i>	<i>Chapter</i>	<i>Page</i>
14. Technical foams and applications	217	16. Appliances	245
Semi-rigid foams	217	Appliance design	246
Applications	217	Formulations and properties	250
Formulations	218	Process technology	253
Foam properties	219		
Viscoelastic foams	220	17. Construction	257
Packaging	221	Insulation materials	257
Polyurethane gels	223	Formulation technologies	258
Hydrophilic foams	223	Boardstock	259
Textile laminated polyurethane foams	224	Formulations	260
Post-treated polyurethane foams	225	Blowing agents	261
Reticulated foams	225	Mixing	262
Impregnated foams	226	Facers	262
Rebonded foams	226	Lay-down	262
Carpet backing foams	227	Conveyor	263
		Line speed – board thickness	265
		Cutting and stacking	265
15. Introduction to rigid foams	229	Sandwich panels	266
Basic science	229	Formulations	268
Chemical processes during foam formation	230	Continuous lamination	269
Physical processes during foam formation	230	Discontinuous manufacture	271
Formulation design for optimum processing and end properties	231		
Blowing agents	232	18. Other construction applications	273
Key criteria for blowing agent choice	233	Insulated pipe	273
Heat transfer	233	Discontinuous moulding	274
Fundamental aspects of thermal conductivity	234	Continuous moulding	277
Radiative transfer ($\lambda_{\text{radiative}}$)	235	Continuous spray	277
Solid conduction (λ_{solid})	235	Spray insulation	278
Gaseous conduction (λ_{gas})	235	One-component foam (OCF)	281
Thermal conductivity ageing	236	Water heaters	282
Basic theory	236	Other niche applications	283
Thermal conductivity ageing under service conditions	238	Buoyancy	283
Industry standards for thermal performance	239	Surfboards	283
Open-cell foam	239	Aircraft propellers/windsails	283
Key testing methods	241	Floral foam applications	283
Thermal conductivity	241	Wall, soil and mine stabilisation	284
Compression strength	242	Low-density semi-structural foams	284
Dimensional stability	243	High-density structural foams	284
Closed-cell content	243		
Water vapour transmission	244	19. Introduction to elastomers	285
		Theory of polyurethane elastomers	286
		Test methods	294
		Standard mechanical properties	294
		Dynamic property testing	297
		Frictional properties	298
		Thermal analysis	298
		Environmental exposure testing	299

<i>Chapter</i>	<i>Page</i>	<i>Chapter</i>	<i>Page</i>
20. Elastomers for footwear applications	301	23. Introduction to coatings, adhesives, sealants and encapsulants	347
Two-component polyurethanes	303	Raw materials	349
Polyester technology	303	Isocyanates	349
Polyether technology	306	Polyols	349
Hybrid technology	307	Other ingredients	350
Additives	308	Surface interactions	350
Process technology for two-component polyurethanes	309	Reactions at surfaces and interfaces	352
Machinery	309	Solidification and bonding	353
Moulds	310	Test methods	353
Mould release	310	Properties of basic materials	354
Thermoplastic polyurethanes	311	Sample preparation	358
		Final product properties	358
21. Thermoplastic polyurethanes	315	Environmental issues and future trends	361
Applications	316	24. Coatings	363
Automotive	316	Materials selection	364
Engineering	317	Isocyanates	364
Footwear	318	Polyols	364
Medical	318	Amines	365
Pipe, hose and tube	319	Solvents	365
Wire and cable	320	Technology of reactive coatings	366
Film, sheet and calendared articles	320	Two-component polyurethane coatings	366
Raw materials and properties	321	Oven-curing or stoving systems	372
Production	324	One-component polyurethane coatings	374
Batch process	325	Technology of non-reactive coatings	375
Band casting	325	Solvent-borne lacquers	375
Reactive extrusion	326	Polyurethane dispersions	375
Processing	327	Urethane oils and alkyds	377
Compounding	327	Radiation curing	377
Polymer blends	328	25. Adhesives	379
Powder	328	Types of adhesive technology	379
Drying	328	Materials selection	382
Injection moulding	328	Non-reactive polyurethane adhesives	384
Extrusion	329	Solvent-borne adhesives	384
Rotational moulding	330	Water-borne adhesives	386
		Hot-melt adhesives	387
22. Other two-component elastomers	331	Reactive polyurethane adhesives	388
Cast elastomers	331	One-component adhesives	388
Synthetic leathers	336	Two-component adhesives	391
Elastomeric fibres	338	Reactive hot-melt	393
Integral skin foams	339	Hybrid systems	394
Reaction injection moulding elastomers	342		
Polyurea elastomers	344		

<i>Chapter</i>	<i>Page</i>	<i>Chapter</i>	<i>Page</i>
26. Wood adhesives	395	30. The use of polyurethane composites in automotive applications	437
Mechanisms of adhesion	397	Automotive interiors	437
Types of wood composites	399	Door panels	439
Oriented strand board (OSB)	399	Sun-shades	440
Medium density fibreboard (MDF)	403	Package trays	441
Engineered lumber (EL)	405	Headliners	441
Other types of wood composites	408	Seatbacks	442
		Load floors and floor pans	442
27. Sealants and encapsulants	409	Automotive exteriors	442
Sealants	409	Future trends	444
Applications	410	Appendix 1: Calculations	447
Formulations and properties of sealants	410	Appendix 2: Conversion factors	453
Encapsulants	416	Appendix 3: Physical properties of isocyanates	455
Applications	416	Index	457
Formulations and properties of encapsulants	417		
28. Introduction to polyurethane composites	419		
General properties of composites	420		
Design considerations when working with composites	421		
Stress analysis	421		
Detailed design	421		
Raw materials	422		
Polyurethane systems	422		
Form and types of glass fibre	422		
Mineral reinforcements	423		
Carbon fibre	424		
Natural fibre	424		
Processing techniques	424		
Test procedures	424		
29. Polyurethane composite technology	427		
SRIM, P4 and LD-SRIM	427		
RRIM	429		
Sprayed chopped fibre	429		
Filament winding	430		
Pultrusion	431		
Mould technology	431		
Formulations and properties	432		
Choice of process	434
