Some Physical Constants of Interest in Spectroscopy xvii

A Periodic Table of the Elements for Optical Spectroscopy xix

1 Fundamentals 1
1.1 The Origins of Spectroscopy 1
1.2 The Electromagnetic Spectrum and Optical Spectroscopy 2
1.3 Absorption 8
1.3.1 The Absorption Coefficient 8
1.3.2 The Measurement of Absorption Spectra: The Spectrophotometer 11
1.3.3 Reflectivity 15
1.4 Luminescence 16
1.4.1 The Measurement of Photoluminescence: The Spectrofluorimeter 17
1.4.2 Luminescent Efficiency 20
1.4.3 Stokes and Anti-Stokes Shifts 22
1.4.4 Time-Resolved Luminescence 25
1.5 Scattering: The Raman Effect 28
1.6 Advanced Topic: The Fourier Transform Spectrometer 33
Exercises 36
References and Further Reading 38

2 Light Sources 39
2.1 Introduction 39
2.1.1 Thermal Radiation and Planck's Law 39
2.2 Lamps 41
2.2.1 Tungsten and Quartz Halogen Lamps 42

2.2.2 Spectral Lamps 42
2.2.3 Fluorescent Lamps 43
2.2.4 High-Pressure Discharge Vapor Lamps 44
2.2.5 Solid State Lamps 44
2.3 The Laser 45
2.3.1 Lasers as Light Sources in Spectroscopy 45
2.3.2 The Basic Principles of Lasers 47
2.3.3 Population Inversion: the Threshold Condition 48
2.3.4 Pumping Techniques 51
2.3.5 The Resonator 52
2.4 Types of Lasers 52
2.4.1 The Excimer Laser 53
2.4.2 Gas Lasers 55
2.4.3 Dye Lasers 57
2.4.4 Semiconductor Lasers 60
2.4.5 Solid State Lasers 62
2.5 The Tunability of Laser Radiation 64
2.5.1 Tunable Solid State Lasers 64
2.5.2 Tunable Coherent Radiation by Frequency-Mixing Techniques 67
2.5.3 Optical Parametric Oscillation and Amplification 68
2.6 Advanced Topics: Site Selective Spectroscopy and Excited State Absorption 71
2.6.1 Site Selective Spectroscopy 72
2.6.2 Excited State Absorption 73
Exercises 74
References and Further Reading 74

3 Monochromators and Detectors 77
3.1 Introduction 77
3.2 Monochromators 77
3.3 Detectors 82
3.3.1 Basic Parameters 83
3.3.2 Types of Detectors 84
3.4 The Photomultiplier 93
3.4.1 The Working Principles of a Photomultiplier 93
3.4.2 Noise in Photomultipliers 97
3.5 Optimization of the Signal-to-Noise Ratio 101
3.5.1 The Averaging Procedure 101
3.5.2 The Lock-in Amplifier 101
3.5.3 The Photon Counter 103
3.5.4 The Optical Multichannel Analyzer 104
3.6 Detection of Pulses 106
3.6.1 Digital Oscilloscopes 107
3.6.2 The Boxcar Integrator 107

3.7 Advanced Topics: The Streak Camera and the Autocorrelator 108
3.7.1 The Streak Camera 108
3.7.2 The Autocorrelator 109
Exercises 111
References and Further Reading 112

4 The Optical Transparency of Solids 113
4.1 Introduction 113
4.2 Optical Magnitudes and the Dielectric Constant 113
4.3 The Lorentz Oscillator 116
4.4 Metals 122
4.4.1 Ideal Metal 123
4.4.2 Damping Effects 126
4.5 Semiconductors and Insulators 127
4.6 The Spectral Shape of the Fundamental Absorption Edge 131
4.6.1 The Absorption Edge for Direct Transitions 133
4.6.2 The Absorption Edge for Indirect Transitions 135
4.7 Excitons 139
4.7.1 Weakly Bound (Mott–Wannier) Excitons 140
4.7.2 Tightly Bound (Frenkel) Excitons 143
4.8 Advanced Topic: The Color of Metals 144
Exercises 146
References and Further Reading 149

5 Optically Active Centers 151
5.1 Introduction 151
5.2 Static Interaction 152
5.2.1 Crystalline Field Theory 153
5.2.2 Molecular Orbital Theory 159
5.3 Band Intensities 161
5.3.1 The Absorption Probability 161
5.3.2 Allowed Transitions and Selection Rules 163
5.3.3 Polarized Transitions 165
5.3.4 The Probability of Spontaneous Emission 166
5.3.5 The Effect of the Crystal on the Transition Probabilities 167
5.3.6 Oscillator Strength: Smakula's Formula 168
5.4 Dynamic Interaction: The Configurational Coordinate Diagram 170
5.5 Band Shape: The Huang–Rhys Coupling Parameter 175
5.6 Nonradiative Transitions 181
5.6.1 Multiphonon Emission 182
5.6.2 Energy Transfer 183
5.6.3 The Concentration Quenching of Luminescence 188
5.7 Advanced Topic: The Determination of Quantum Efficiencies 191

Exercises 195
References and Further Reading 197

6 Applications: Rare Earth and Transition Metal Ions, and Color Centers 199
6.1 Introduction 199
6.2 Rare Earth Ions 200
6.2.1 Trivalent Rare Earth Ions: The Dieke Diagram 200
6.2.2 Divalent Rare Earth Ions 205
6.3 Nonradiative Transitions in Rare Earth Ions: The 'Energy-Gap' Law 206
6.4 Transition Metal Ions 210
6.4.1 $3d^1$ Ions 211
6.4.2 $3d^n$ Ions: Sugano–Tanabe Diagrams 212
6.5 Color centers 220
6.6 Advanced Topics: The Judd and Ofelt Formalism, and Optical Cooling of Solids 224
6.6.1 The Judd and Ofelt Formalism 225
6.6.2 Optical Cooling of Solids 228
Exercises 231
References and Further Reading 233

7 Group Theory and Spectroscopy 235
7.1 Introduction 235
7.2 Symmetry Operations and Classes 236
7.3 Representations: The Character Table 240
7.4 Reduction in Symmetry and The Splitting of Energy Levels 244
7.5 Selection Rules for Optical Transitions 251
7.6 Illustrative Examples 253
7.7 Advanced Topic: The Application to Optical Transitions of Kramers Ions 256
Exercises 260
References and Further Reading 262

Appendix A1 The Joint Density of States 263
Appendix A2 The Effect of an Octahedral Field on a d^1 Valence Electron 266
Appendix A3 The Calculation of the Probability of Spontaneous Emission by Means of Einstein's Thermodynamic Treatment 271
Appendix A4 The Determination of Smakula's Formula 274

Index 277
