

The Genetical Analysis of Quantitative Traits

Michael J. Kearsey
and Harpal S. Pooni

Contents

Preface	xi
Dedication	xiii
1 Introduction	1
1.1 Qualitative, single gene differences	2
1.2 What are quantitative traits?	4
1.3 Who studies quantitative traits?	6
1.4 Why are quantitative traits important?	8
1.5 What do we need to know about quantitative traits?	10
1.6 Historical development of quantitative genetics	13
Summary	16
References	16
Further reading	17
2 Basic generations – means	18
2.1 Single gene model with additive and dominance effects	19
2.2 Two gene model with additive and dominance effects	21
2.3 Multiple gene model with additive and dominance effects	22
2.4 Extension to other generations	25
2.5 Relationships between generation means	27
2.6 Estimating genetical parameters	30
2.7 Interpretation: heterosis and potency ratio	33
Summary	36
References	36
3 Basic generations – variances	38
3.1 Variation in the non-segregating generations	38
3.2 Environmental variation	39
3.3 Estimating environmental variance	41
3.4 Variation in the segregating generations	42
3.5 Estimation of genetical components	45

3.6	Heritability, h^2	48
3.7	Relationships between $[a]$ and V_A^* , and $[d]$ and V_D^*	49
3.8	Dominance ratio	50
3.9	Variances and means	51
3.10	Conclusions from the analysis of basic generations	51
	Summary	51
	References	52
	Further reading	52
4	Selfing and full-sib mating	53
4.1	Selfing: F_3 families	54
4.2	Selfing: F_4 families and beyond	57
4.3	Applications of selfing theory	61
4.4	Variation between inbred lines derived from an F_2	63
4.5	Sib-mating an F_2	65
4.6	Sib-mating: regression of offspring onto the parents	70
4.7	Further inbreeding by full-sib mating	72
4.8	Estimation of variance components by weighted least squares	73
4.9	Unequal family sizes	74
	Summary	75
	References	75
5	Half-sib mating designs	77
5.1	The North Carolina Experiment I: NCI	77
5.2	The North Carolina Experiment II: NCII	82
5.3	General and specific combining ability	84
5.4	Multiple NCIIIs	85
5.5	The North Carolina Experiment III: NCIII	86
5.6	The Triple Test Cross: TTC	92
5.7	The diallel cross	95
5.8	HS designs using inbred lines from an F_2 as parents	97
	Summary	98
	References	99
6	Genes, genetic markers and maps	101
6.1	Genetic markers	102
6.2	Structural and regulatory genes	102
6.3	Mutations in structural genes	103
6.4	Molecular genetic markers	107
6.5	Chiasmata, crossing over and genetic exchange	111
6.6	Chiasma frequency and recombination frequency	117
6.7	Estimation of recombination frequency	120
6.8	Mapping functions	127
6.9	Segregation distortion	130

Summary	131
References	132
Further reading	133
7 Gene counting and location	133
7.1 Reasons for locating QTL	133
7.2 Background to methodology	134
7.3 QTL and marker loci in segregating generations	137
7.4 Handling more than one QTL on a chromosome	151
7.5 Biometrical methods of gene counting	156
7.6 General conclusions on QTL counting and locating	160
Summary	162
References	162
Further reading	164
8 Designer chromosomes	165
8.1 Chromosome engineering	165
8.2 Locating a QTL within the substituted region	168
8.3 Detecting substitution effects	170
8.4 Manipulating whole chromosomes	172
8.5 Chromosome substitution methods in different species	173
8.6 Use of chromosome substitution lines	182
Summary	184
References	184
9 Populations	186
9.1 Problems of studying populations	186
9.2 Solutions	187
9.3 Consequences of definitions of V_A and V_D	189
9.4 Studies of human populations	192
9.5 The use of twins	194
9.6 Heritabilities of human traits	197
9.7 Genotype-environment correlation	198
9.8 Diallel crosses	200
9.9 Inbreeding in a population	201
Summary	203
References	204
10 The consequences of linkage	205
10.1 Genetic variation with linkage	205
10.2 Extension to more than two genes	208
10.3 Linkage and random mating an F_2	210
10.4 Linkage and inbreeding an F_2	212
10.5 Linkage disequilibrium in populations in general	212
10.6 Tests of linkage	213
10.7 Sex linkage	215

10.8	Basic generations of single crosses	216
10.9	Full-sib families	219
10.10	Half-sib designs	220
	Summary	222
	References	223
11	Epistasis	224
11.1	Definitions	225
11.2	Relationship with classical epistasis	226
11.3	What is parameter m ?	228
11.4	The effects of association and dispersion on epistasis	228
11.5	Deriving the expectations of generation means	231
11.6	Estimates and tests of significance	232
11.7	Determining the type of epistasis for a multigene case	234
11.8	Epistasis and scaling tests	234
11.9	Higher order interactions	235
11.10	Epistasis and variances	236
	Summary	239
	References	240
12	Genotype by environment interaction	241
12.1	The nature and causes of $G \times E$	241
12.2	Tests of $G \times E$	244
12.3	Macro-environmental variables	245
12.4	$G \times E$ with many lines	251
12.5	Interpretation of $G \times E$ analysis	252
12.6	Predictions in the presence of $G \times E$	254
12.7	Conclusions from the genetic analysis of $G \times E$	255
12.8	Selection in heterogeneous environments	257
12.9	Other methods of analysis	259
12.10	$G \times E$ – stability versus flexibility	262
	Summary	263
	References	263
	Further reading	265
13	Maternal effects and non-diploids	266
13.1	Maternal effects	266
13.2	Models for generation means	267
13.3	Maternal effects and scaling tests	269
13.4	Generation variances	272
13.5	Maternal effects in FS and HS designs	273
13.6	Haploids and polyploids	274
13.7	Basic generations with haploids	274
13.8	Multiple mating designs with haploids	277

13.9 Basic generations with polyploids	278
13.10 Multiple mating designs with polyploids	282
Summary	283
References	283
14 Correlated and threshold characters	285
14.1 Correlations between characters	285
14.2 Environmental correlations	287
14.3 Genetic correlations	288
14.4 Genetic covariation and design of experiment	291
14.5 Causes of covariation	292
14.6 General conclusions about correlations	294
14.7 Threshold traits	294
14.8 Handling threshold traits	296
14.9 Two or more thresholds	298
Summary	300
References	300
Further reading	301
15 Applications	302
15.1 Choice of breeding objective	302
15.2 The causes of heterosis	304
15.3 Predicting the breeding potential of crosses	308
15.4 Effects of failed assumptions on predictions of RILs and SCHs	314
15.5 Predicting the response to selection	315
15.6 Correlated response to selection	321
15.7 Indirect selection	322
15.8 Multi-trait selection	323
15.9 Marker-based selection	324
15.10 Genetic architecture of populations	327
15.11 Human populations	329
Summary	332
References	333
Further reading	334
16 Experimental design	335
16.1 Replication	335
16.2 Power of experiments	339
16.3 Power of biometrical experiments based on ANOVA	342
16.4 Reliability of the additive genetic variance	346
16.5 Data analysis	347
Summary	348
References	349
Further reading	349

Appendix A	Precision of h_n^2 with FS families	350
Appendix B	Precision of h_n^2 with HS families	351
Appendix C	Statistical tables; F, χ^2 , t	352
Appendix D	Normal deviate and intensity of selection (i)	354
Appendix E	Area under the normal curve	355
Appendix F	The weighted least squares procedure	356
