

Genetic Improvement of Cattle and Sheep

Geoff Simm

CONTENTS

Foreword by Professor W G Hill	viii
Preface	ix
Acknowledgements	xi
Chapter 1. The origins of today's livestock breeds	1
Natural selection and evolution	1
Domestication	2
Origins of livestock breeds	4
Summary	5
Chapter 2. Genes, genetic codes and genetic variation	7
Introduction	7
Chromosomes and genes	8
The structure and function of genes	11
DNA and genetic codes	11
Loci and alleles	13
Transfer of genetic codes during cell division	14
Mitosis	15
Meiosis	16
Mutation	17
Tracking genes across generations	19
Genes, genotypes and phenotypes	19
Predicting the outcome of matings between different genotypes ...	21
Genotype and gene frequencies	24
Sources of genetic variation between animals	26
Types of gene action	28
Additive and non-additive gene action	28
Co-dominance, no dominance or additive gene action	28
Complete dominance	30
Partial dominance	33
Overdominance	33
Other types of gene action and inheritance	33
Sex-linked genes	33
Sex-limited genes	34
Sex-influenced genes	34
Genomic imprinting	34
Pleiotropy	35
Epistasis	35
Incomplete penetrance and variable expressivity	36
Cytoplasmic or mitochondrial inheritance	36
Names of genes and their abbreviations	37
The nature of traits of interest in farm animals	38
Qualitative and quantitative traits	38
Genetic and environmental influences	38
Traits affected by single genes	40
Traits affected by many genes	41
Measuring variation in performance	46
Measuring associations between traits and between animals	50

Phenotypic, genetic and environmental associations	55
Summary	58
Chapter 3. Strategies for genetic improvement	64
Introduction	64
The structure of livestock breeding industries	65
Selection between breeds	70
Selection within breeds	74
Requirements for within-breed selection	76
Factors affecting rates of improvement	78
Selection for more than one trait	81
Crossbreeding	83
Reasons for crossing	83
Types of heterosis	89
Systems of crossing	93
Conservation of genetic resources	95
Why conserve rare breeds?	95
Which breeds should be conserved?	97
Methods of conservation	98
Summary	100
Chapter 4. What affects response to selection within breeds?	107
Introduction	107
Factors affecting rates of genetic gain	108
Selection differential	108
Heritability	109
Generation interval	112
A more useful formula for predicting response	113
The link between selection intensity and generation interval ...	117
Using information from relatives	120
Accuracy of selection	123
Additive genetic standard deviation	124
A practical example	126
Using repeated records of performance	128
Predicting correlated responses to selection	131
Limitations of these predictions	132
Controlling inbreeding	134
Summary	141
Chapter 5. Predicting breeding values	148
Introduction	148
Management of candidates for selection	148
Adjusting records of performance	149
Additive correction factors	149
Multiplicative correction factors	151
Standardising to adjust records	151
Predicting breeding values	153
Clues to an animal's breeding value	153
Calculating PBVs	153
Using the animal's own performance	153
Using information from relatives	155

Selection indexes	158
Combining information on a single trait from relatives ...	159
Combining information on different traits	160
A practical example	163
BLUP	165
How BLUP works	167
BLUP models	171
Direct and maternal genetic effects	172
Single and multi-trait BLUP	174
Benefits of BLUP	175
Using economic values with BLUP	176
Getting estimates of heritabilities and correlations	177
Scale of presentation of genetic merit	178
Accuracies and reliabilities	179
International conversions and evaluations	183
International conversions	183
Factors affecting feasibility and reliability	183
An example	185
International evaluations	186
Summary	188
Chapter 6. Dairy cattle breeding	196
Introduction	196
Breeding goals	197
Breeds and crosses used in dairying	203
Selection within breeds	206
Systems of testing	206
Progeny testing schemes	206
How progeny testing works	206
Pathways of genetic improvement with progeny testing	210
Pros and cons of progeny testing	210
Nucleus breeding schemes	211
Theoretical benefits	211
MOET schemes in practice	214
Do MOET nucleus schemes work?	216
Traits recorded	217
Milk recording	217
Type traits	219
Reproduction, health and workability	222
Feed intake, live weight and body condition	225
Methods and results of genetic evaluation	226
Milk production traits	226
Other traits	231
Indexes of overall economic merit	233
Evidence of genetic improvement and its value	237
Genotype x environment interactions	240
Practical guidelines on selection	242
Summary	244

Chapter 7. Beef cattle breeding	253
Introduction	253
Breeding goals	255
Beef breeding goals in dairy and dual-purpose breeds	255
Terminal sires for use in dairy herds and specialised beef herds	256
Breeding replacement females for specialised beef herds	259
Breeds and crosses used in beef production	261
Selection within breeds	264
Systems of testing	264
Performance testing	264
Progeny testing	266
Cooperative breeding schemes	267
MOET nucleus schemes	268
Traits recorded	268
Methods and results of genetic evaluation	273
Overview	273
Steps involved in genetic evaluation	275
Evaluations across herds, breeds and countries	283
Indexes of overall economic merit	284
Evidence of genetic improvement and its value	286
Estimates of genetic change	286
Value of genetic improvement	288
Genotype x environment interactions	289
Practical guidelines on selection	289
Selection between breeds or crosses	290
Selection of bulls (or semen) for use in a purebred herd	290
Selection of replacement females in a purebred herd	291
Selection of replacement bulls and cows for a commercial herd	292
Summary	292
Chapter 8. Sheep breeding	300
Introduction	300
Breeding goals	302
Meat production	302
Wool production	306
Milk production	308
Multi-purpose breeding goals	309
Breeds and crosses used in sheep production	310
Meat production	310
Wool production	312
Dual-purpose meat and wool production	313
Milk production	314
Selection within breeds	314
Meat production	314
Systems of testing	314
Traits recorded	318
Methods and results of genetic evaluation	322
Use of indexes of overall economic merit	324
Evidence of genetic improvement and its value	328

Wool production	332
Systems of testing	332
Traits recorded	333
Methods of genetic evaluation	335
Use of indexes of overall economic merit	335
Evidence of genetic improvement and its value	335
Milk production	336
Genotype x environment interactions	337
Practical guidelines on selection	337
Selection between breeds or crosses	338
Selection of rams (or semen) for use in a purebred flock	338
Selection of replacement females in a purebred flock	339
Selection of replacement rams and ewes for a commercial flock	340
Summary	340
Chapter 9. New technologies	347
Introduction	347
Reproductive technologies	348
Artificial insemination	349
Multiple ovulation and embryo transfer	350
<i>In vitro</i> production of embryos	352
Semen and embryo sexing	354
Embryo cloning	355
Molecular genetic technologies	358
Developments in molecular and cell biology	359
Genome mapping	364
Types of genome map	365
Linkage maps	365
Physical maps	367
Creating a consensus map	371
Status of livestock genome maps	371
Use of molecular markers in selection	372
Choice of markers	373
Establishing a link between a marker and a trait of interest	375
An example of marker assisted introgression	378
An example of marker assisted selection	381
Gene transfer	382
Ethical implications of new technologies	385
Summary	390

Table showing values of selection intensity for different proportions of animals selected	400
--	------------

Glossary of technical terms	404
--	------------

A colour section appears between pages 146-147 and pages 274-275
