Statistical Design of Experiments with Engineering Applications

Kamel Rekab
Muzaffar Shaikh

Chapman & Hall/CRC
Taylor & Francis Group

Table of Contents

1. Introduction 1
   - 1.1 What Is Experimental Design? 1
   - 1.2 Applications of Experimental Design 2
   - 1.3 Old Philosophy of Quality 3
   - 1.4 New Philosophy of Quality 4
   - 1.5 Robust Design 6
   - 1.6 Experimentation Steps 7
   - 1.7 Goals and Outline of the Design of Experiments Concepts 9
   - 1.8 Problems 9

   References 10

2. Designing and Conducting the Experiment 13
   - 2.1 Introduction 13
   - 2.2 One-Factor-at-a-Time Approach 13
   - 2.3 Two-Level Factorial Designs 16
     - A. Two-Level Full Factorial Designs 17
     - B. Fractional Factorial Designs of Resolution III 25
     - C. Plackett-Burman (PB) Designs 31
     - D. Fractional Factorial Designs of Resolution IV 36
     - E. Fractional Factorial Designs of Resolution V 44
   - 2.4 Problems 52

   References 52

3. Optimization of the Location Parameter 55
   - 3.1 Introduction 55
   - 3.2 Guidelines for Location Optimization 56
   - 3.3 Replicated Experimental Runs 57
     - A. Maximizing the Location Parameter 57
     - B. Prediction 61
     - C. Hit a Target 62
   - 3.4 An Alternative Approach to the Pareto Chart 67
   - 3.5 Problems 78

   References 80

4. Minimization of the Dispersion 81
4.1 Introduction 81
4.2 Dispersion Minimization for Replicated Study 83
4.3 Dispersion Minimization for Unreplicated Study 89
4.4 Problems 96
References 96

5. Taguchi's Approach to the Design of Experiments 97
5.1 Introduction 97
5.2 Loss Function 98
5.3 Taguchi Designs 99
5.4 Signal-to-Noise Ratio 101
A. Nominal-Is-the-Best 101
B. Large-Is-the-Best 103
C. Small-Is-the-Best 104
5.5 Applications of Taguchi's Approach to Robust Designs 106
A. Analysis: Large-Is-the-Best 106
B. Analysis: Small-Is-the-Best 109
C. Analysis: Nominal-Is-the-Best 113
5.6 Comments on the Taguchi Method 119
5.7 Problems 119
References 120

6. Statistical Optimization of the Location Parameter 121
6.1 Introduction 121
6.2 Replicated Two-Level Full Factorial Design 123
6.3 Unreplicated Two-Level Full Factorial Design 128
6.4 Two-Level Fractional Factorial Design 133
6.5 Problems 138
References 141

7. Statistical Minimization of the Dispersion Parameter 143
7.1 Introduction 143
7.2 Replicated Study 143
A. Analysis of Variance Techniques 143
B. Normal Probability Plot of Effects 149
7.3 Unreplicated Study 150
7.4 Problems 154
References 154

8. Validity of the Prediction Equation 155
8.1 Introduction 155
8.2 Graphic Analysis 155
8.3 Adjusted Coefficient of Determination 163
8.4 F Test for Lack of Fit 164
8.5 Analysis Recommendation 167
8.6 Problems 169
References 169

9. Three-Level Factorial Designs 171
9.1 Introduction 171
9.2 Three-Level Full Factorial Design 171
9.3 Box-Behnken Designs 174
9.4 Central Composite Designs 177
A. Rotatable Central Composite Design 178
B. Face Centered Central Composite Design 187
9.5 Three-Level Taguchi Designs 188
9.6 Problems 190
References 191

10. Second-Order Analysis 193
10.1 Introduction 193
10.2 Second-Order Model in Matrix Terms 193
10.3 Estimation of the Second-Order Model Parameters 195
10.4 Estimation of the First-Order Model Parameters 196
10.5 Fitting a Second-Order Model 198
10.6 Inferences about Regression Parameters 201
10.7 Confidence Limits for Predicted Values 202
10.8 Validity of the Prediction Equation 205
10.9 Quadratic Optimization 205
A. Stationary Point 206
B. Optimal Point 206
10.10 Problems 212
References 213

Appendices
Appendix 1 Two-Level Fractional Factorial Designs 215
Appendix 2 Plackett-Burman Designs 219
Appendix 3 Taguchi Designs 221
Appendix 4 Standardized Normal Distribution 225
Appendix 5 Percentiles of the t Distribution 227
Appendix 6 Percentiles of the F Distribution 229
Appendix 7 Some Useful Box-Behnken Designs 239

Appendix 8 Matrix Algebra 241
8.1 Matrices 241
8.2 Matrix Addition and Subtraction 243
8.3 Matrix Multiplication 243
8.4 Special Types of Matrices 244
8.5 Inverse of a Matrix 245

Index 249
