

Nonlinear Dynamic Modeling of Physiological Systems

VASILIS Z. MARMARELIS

Contents

Prologue	xiii
1 Introduction	1
1.1 Purpose of this Book	1
1.2 Advocated Approach	4
1.3 The Problem of System Modeling in Physiology	6
1.3.1 Model Specification and Estimation	10
1.3.2 Nonlinearity and Nonstationarity	12
1.3.3 Definition of the Modeling Problem	13
1.4 Types of Nonlinear Models of Physiological Systems	13
Example 1.1. Vertebrate Retina	15
Example 1.2. Invertebrate Photoreceptor	18
Example 1.3. Volterra analysis of Riccati Equation	19
Example 1.4. Glucose-Insulin Minimal Model	21
Example 1.5. Cerebral Autoregulation	22
1.5 Deductive and Inductive Modeling	24
Historical Note #1: Hippocratic and Galenic Views of Integrative Physiology	26
2 Nonparametric Modeling	29
2.1 Volterra Models	31
2.1.1 Examples of Volterra Models	37
Example 2.1. Static Nonlinear System	37
Example 2.2. L - N Cascade System	38
Example 2.3. L - N - M "Sandwich" System	39
Example 2.4. Riccati System	40

2.1.2	Operational Meaning of the Volterra Kernels	41
	Impulsive Inputs	42
	Sinusoidal Inputs	43
	Remarks on the Meaning of Volterra Kernels	45
2.1.3	Frequency-Domain Representation of the Volterra Models	45
2.1.4	Discrete-Time Volterra Models	47
2.1.5	Estimation of Volterra Kernels	49
	Specialized Test Inputs	50
	Arbitrary Inputs	52
	Fast Exact Orthogonalization and Parallel-Cascade Methods	55
	Iterative Cost-Minimization Methods for Non-Gaussian Residuals	55
2.2	Wiener Models	57
2.2.1	Relation between Volterra and Wiener Models	60
	The Wiener Class of Systems	62
	Examples of Wiener Models	63
	Comparison of Volterra/Wiener Model Predictions	64
2.2.2	Wiener Approach to Kernel Estimation	67
2.2.3	The Cross-Correlation Technique for Wiener Kernel Estimation	72
	Estimation of h_0	73
	Estimation of $h_1(\tau)$	73
	Estimation of $h_2(\tau_1, \tau_2)$	74
	Estimation of $h_3(\tau_1, \tau_2, \tau_3)$	75
	Some Practical Considerations	77
	Illustrative Example	78
	Frequency-Domain Estimation of Wiener Kernels	78
2.2.4	Quasiwhite Test Inputs	80
	CSRS and Volterra Kernels	84
	The Diagonal Estimability Problem	85
	An Analytical Example	86
	Comparison of Model Prediction Errors	88
	Discrete-Time Representation of the CSRS Functional Series	89
	Pseudorandom Signals Based on m -Sequences	89
	Comparative Use of GWN, PRS, and CSRS	92
2.2.5	Apparent Transfer Function and Coherence Measurements	93
	Example 2.5. L - N Cascade System	96
	Example 2.6. Quadratic Volterra System	97
	Example 2.7. Nonwhite Gaussian Inputs	98
	Example 2.8. Duffing System	98
	Concluding Remarks	99
2.3	Efficient Volterra Kernel Estimation	100
2.3.1	Volterra Kernel Expansions	101
	Model Order Determination	104
2.3.2	The Laguerre Expansion Technique	107
	Illustrative Examples	112
2.3.3	High-Order Volterra Modeling with Equivalent Networks	122
2.4	Analysis of Estimation Errors	125
2.4.1	Sources of Estimation Errors	125

2.4.2	Estimation Errors Associated with the Cross-Correlation Technique	127
	Estimation Bias	128
	Estimation Variance	130
	Optimization of Input Parameters	131
	Noise Effects	134
	Erroneous Scaling of Kernel Estimates	136
2.4.3	Estimation Errors Associated with Direct Inversion Methods	137
2.4.4	Estimation Errors Associated with Iterative Cost-Minimization Methods	139
	Historical Note #2: Vito Volterra and Norbert Wiener	140
3	Parametric Modeling	145
3.1	Basic Parametric Model Forms and Estimation Procedures	146
3.1.1	The Nonlinear Case	150
3.1.2	The Nonstationary Case	152
3.2	Volterra Kernels of Nonlinear Differential Equations	153
	Example 3.1. The Riccati Equation	157
3.2.1	Apparent Transfer Functions of Linearized Models	158
	Example 3.2. Illustrative Example	160
3.2.2	Nonlinear Parametric Models with Intermodulation	161
3.3	Discrete-Time Volterra Kernels of NARMAX Models	164
3.4	From Volterra Kernel Measurements to Parametric Models	167
	Example 3.3. Illustrative Example	169
3.5	Equivalence Between Continuous and Discrete Parametric Models	171
	Example 3.4. Illustrative Example	175
3.5.1	Modular Representation	177
4	Modular and Connectionist Modeling	179
4.1	Modular Form of Nonparametric Models	179
4.1.1	Principal Dynamic Modes	180
	Illustrative Examples	186
4.1.2	Volterra Models of System Cascades	191
	The L - N - M , L - N , and N - M Cascades	194
4.1.3	Volterra Models of Systems with Lateral Branches	198
4.1.4	Volterra Models of Systems with Feedback Branches	200
4.1.5	Nonlinear Feedback Described by Differential Equations	202
	Example 1. Cubic Feedback Systems	204
	Example 2. Sigmoid Feedback Systems	209
	Example 3. Positive Nonlinear Feedback	213
	Example 4. Second-Order Kernels of Nonlinear Feedback Systems	215
	Nonlinear Feedback in Sensory Systems	216
	Concluding Remarks on Nonlinear Feedback	220
4.2	Connectionist Models	223
4.2.1	Equivalence between Connectionist and Volterra Models	223
	Relation with PDM Modeling	230
	Illustrative Examples	232

4.2.2	Volterra-Equivalent Network Architectures for Nonlinear System Modeling	235
	Equivalence with Volterra Kernels/Models	238
	Selection of the Structural Parameters of the VEN Model	238
	Convergence and Accuracy of the Training Procedure	240
	The Pseudomode-Peeling Method	244
	Nonlinear Autoregressive Modeling (Open-Loop)	246
4.3	The Laguerre-Volterra Network	246
	Illustrative Example of LVN Modeling	249
	Modeling Systems with Fast and Slow Dynamic (LVN-2)	251
	Illustrative Examples of LVN-2 Modeling	255
4.4	The VWM Model	260
5	A Practitioner's Guide	265
5.1	Practical Considerations and Experimental Requirements	265
5.1.1	System Characteristics	266
	System Bandwidth	266
	System Memory	267
	System Dynamic Range	267
	System Linearity	268
	System Stationarity	268
	System Ergodicity	268
5.1.2	Input Characteristics	269
5.1.3	Experimental Characteristics	270
5.2	Preliminary Tests and Data Preparation	272
5.2.1	Test for System Bandwidth	272
5.2.2	Test for System Memory	272
5.2.3	Test for System Stationarity and Ergodicity	273
5.2.4	Test for System Linearity	274
5.2.5	Data Preparation	275
5.3	Model Specification and Estimation	276
5.3.1	The MDV Modeling Methodology	277
5.3.2	The VEN/VWM Modeling Methodology	278
5.4	Model Validation and Interpretation	279
5.4.1	Model Validation	279
5.4.2	Model Interpretation	281
	Interpretation of Volterra Kernels	281
	Interpretation of the PDM Model	282
5.5	Outline of Step-by-Step Procedure	283
5.5.1	Elaboration of the Key Step #5	284
6	Selected Applications	285
6.1	Neurosensory Systems	286
6.1.1	Vertebrate Retina	287
6.1.2	Invertebrate Retina	396
6.1.3	Auditory Nerve Fibers	302
6.1.4	Spider Mechanoreceptor	307
6.2	Cardiovascular System	320

6.3	Renal System	333
6.4	Metabolic-Endocrine System	342
7	Modeling of Multiinput/Multioutput Systems	359
7.1	The Two-Input Case	360
7.1.1	The Two-Input Cross-Correlation Technique	362
7.1.2	The Two-Input Kernel-Expansion Technique	362
7.1.3	Volterra-Equivalent Network Models with Two Inputs	364
	Illustrative Example	366
7.2	Applications of Two-Input Modeling to Physiological Systems	369
7.2.1	Motion Detection in the Invertebrate Retina	369
7.2.2	Receptive Field Organization in the Vertebrate Retina	370
7.2.3	Metabolic Autoregulation in Dogs	378
7.2.4	Cerebral Autoregulation in Humans	380
7.3	The Multiinput Case	389
7.3.1	Cross-Correlation-Based Method for Multiinput Modeling	390
7.3.2	The Kernel-Expansion Method for Multiinput Modeling	393
7.3.3	Network-Based Multiinput Modeling	393
7.4	Spatiotemporal and Spectrotemporal Modeling	395
7.4.1	Spatiotemporal Modeling of Retinal Cells	398
7.4.2	Spatiotemporal Modeling of Cortical Cells	401
8	Modeling of Neuronal Systems	407
8.1	A General Model of Membrane and Synaptic Dynamics	408
8.2	Functional Integration in the Single Neuron	414
8.2.1	Neuronal Modes and Trigger Regions	417
	Illustrative Examples	427
8.2.2	Minimum-Order Modeling of Spike-Output Systems	432
	The Reverse-Correlation Technique	432
	Minimum-Order Wiener Models	435
	Illustrative Example	439
8.3	Neuronal Systems with Point-Process Inputs	439
8.3.1	The Lag-Delta Representation of $P-V$ or $P-W$ Kernels	445
8.3.2	The Reduced $P-V$ or $P-W$ Kernels	446
8.3.3	Examples from the Hippocampal Formation	450
	Single-Input Stimulation in Vivo and Cross-Correlation Technique	450
	Single-Input Stimulation in Vitro and Laguerre-Expansion Technique	455
	Dual-Input Stimulation in the Hippocampal Slice	457
	Nonlinear Modeling of Synaptic Dynamics	461
8.4	Modeling of Neuronal Ensembles	463
9	Modeling of Nonstationary Systems	467
9.1	Quasistationary and Recursive Tracking Methods	468
9.2	Kernel Expansion Method	469
9.2.1	Illustrative Example	474
9.2.2	A Test of Nonstationarity	475

9.2.3	Linear Time-Varying Systems with Arbitrary Inputs	479
9.3	Network-Based Methods	480
9.3.1	Illustrative Examples	481
9.4	Applications to Nonstationary Physiological Systems	484
10	Modeling of Closed-Loop Systems	489
10.1	Autoregressive Form of Closed-Loop Model	490
10.2	Network Model Form of Closed-Loop Systems	491
Appendix I	Function Expansions	495
Appendix II	Gaussian White Noise	499
Appendix III	Construction of the Wiener Series	503
Appendix IV	Stationarity, Ergodicity, and Autocorrelation Functions of Random Processes	505
