

NMR Spectroscopy in Inorganic Chemistry

Jonathan A. Iggo

Contents

1	Fundamentals	1
1.1	Introduction	1
1.2	Quantum numbers, energy levels and things	2
	Nuclear spin	2
	Spin angular momentum and the nuclear magnetic moment	2
	Nuclear spin quantum numbers	3
1.3	Nuclear spins interacting with a magnetic field	3
	Effect of an applied field	3
	Energies of the nuclear quantum states	6
1.4	Nuclear magnetic resonance spectroscopy	6
	Resonance frequencies	6
	Selection rules	6
	Intensities	7
1.5	Nuclear spins and their surroundings	7
	Timescales	8
1.6	Chemical Shielding	8
	The chemical shift and the ppm scale	9
1.7	Scalar Coupling	10
	Coupling to a spin $\frac{1}{2}$ nucleus -	
	mechanism of scalar coupling - 1	11
	Mechanism of scalar coupling - 2	12
	Decoupling	12
	Mechanism of decoupling	13
	The coupling constant	13
	Coupling to nuclei with spin $>\frac{1}{2}$	14
	Coupling to several identical spin $\frac{1}{2}$ nuclei	14
	Coupling to several identical spin $>\frac{1}{2}$ nuclei	15
	Coupling to inequivalent nuclei	16
	Stick diagrams	16
1.8	Second order couplings	17
	Chemical vs magnetic equivalence	18
1.9	Natural abundance	19
	Isotopomers	20
	Satellites	21
1.10	Relaxation	21
	Relaxation mechanisms	22
	Dipole-dipole relaxation	22
	Quadrupolar relaxation	23
1.11	Experimental methods	25
	Continuous wave NMR spectroscopy	25
	The Fourier transform method	25

1.12 The vector model and the rotating frame	26
Magnetic moment of a collection of spins	26
Precession of the nuclear spin	27
The rotating frame	27
The excitation pulse	27
Vector model of chemical shifts	28
Vector model of scalar couplings	29
Vector model picture of relaxation	29
Measurement of T_1 and T_2	30
 2 Structure Determination	 31
2.1 Introduction	31
2.2 Interpretation of an NMR spectrum	31
Differentiation of chemical shifts and scalar couplings	31
Determination of couplings and coupling patterns	32
Satellites	34
2.3 General trends in the chemical shift	35
Factors influencing the chemical shift –	
geometry	35
electronegativity, charge, and oxidation state	36
co-ordination number	37
co-ordination – effect on the ligands	38
co-ordination – effect on transition metal	40
2.4 General trends in the coupling constant	41
Factors influencing the coupling constant –	
gyromagnetic ratio	41
periodicity	41
s-character in the bond	42
hybridization	42
co-ordination number	43
electronegativity	43
<i>trans</i> - influence	44
interbond angles	45
lone pairs	47
oxidation state	47
2.5 Relaxation and structure	48
Molecular hydrogen complexes	49
Spectral editing using relaxation times	51
Hydrogen on a metal surface	51
2.6 Multiple pulse methods	52
1-D methods	53
2-D NMR spectroscopy	54
COSY	55
HMQC	57

3	Dynamic processes and NMR	59
3.1	Introduction	59
3.2	Some theory	60
	The NMR timescale	60
	Fast and slow exchange limits	61
	Effect of temperature	61
	Concerted vs non-concerted exchange	61
3.3	Determination of the thermodynamic and kinetic parameters of exchange	63
	The rate constant	63
	ΔG^\ddagger	64
	Lineshape analysis	65
	Differential broadening	66
	Multisite dynamic processes	66
3.4	Effect of dynamic processes on relaxation	67
3.5	Saturation transfer	68
	Monitoring exchange using saturation transfer	69
	Measuring rate using saturation transfer	70
3.6	Effect of exchange on spin-spin coupling	73
	Averaging of the coupling constant in an intramolecular process	73
	Exchange decoupling in an intermolecular process	74
3.7	2-D methods for studying exchange	75
	Exchange Spectroscopy	76
	Multisite exchange	76
	Virtual exchange	76
4	The solid state	80
4.1	Introduction	80
4.2	Nuclear interactions in the solid state	81
	Shielding anisotropy	82
	The principal axis system	82
	Dipolar interactions	83
4.3	Magic angle spinning	84
	Application of MAS-NMR	84
4.4	Cross polarization	85
	Application of cross polarization	86
	Bibliography	87
	Index	88
